## **INTRODUCTION**

### **A: PROJECT LOCATION**

The project site is located on the northeast corner of Alessandro Blvd. and Day St. in the City of Moreno Valley, California. Please see following page for vicinity map.

### **B: STUDY PURPOSE**

The purpose of this study is to determine the 100-year existing condition and proposed condition discharges from the project site that ultimately drains to Alessandro Blvd.

### **C: PROJECT STAFF:**

Thienes Engineering staff involved in this study include:

Reinhard Stenzel  
Tony Nunez  
Kristie Ferronato

## **DISCUSSION**

### Project Description

The project site encompasses approximately 8.2 gross acres with 8.05 net acres. Improvements to the site include a warehouse type building that is approximately 164,489 square feet. There will be a truck yard on the west side of the proposed building. Vehicle parking will be on the north and east sides of the project. Proposed landscaping will be street adjacent and throughout the site.

### Master Plan of Drainage

The site is within the study area of the Line G-G Master Drainage Plan, Project No. 02-8928002, dated December 30, 2004, prepared by AEI CASC Engineering. There are four alternatives for Line G-G. However, the construction of the Line G-G has not been constructed and does not seem likely in the future. Line G-G drains to an existing system in Old 215 Frontage Road.

Please see Appendix A for Line G-G maps and other pertinent reference materials.

### Existing Off-Site Run-On

There are two existing catch basins on Sherman Avenue near the intersection of Nolze and Sherman, one on the northerly side of Sherman Avenue and the other on the southerly side. These catch basins discharge into an earthen ditch on the project site. The ditch flows southwesterly towards Day Street. There is a low spot along Day Street and the runoff is conveyed westerly through an under sidewalk drain to a cross gutter on Day Street. Flows then pass through a second under sidewalk drain along the west side of Day Street, then discharges into an existing ditch on private property. The runoff does not have a clear path to another collection point. These existing storm drain features are labeled on the existing condition hydrology map in Appendix D.

### Existing Condition

In the existing condition, the site is undeveloped. The site can be divided into 2 drainage zones. The northwestern 5.1 acres of the site drain towards the low spot in Day Street. This runoff continues westerly in a cross gutter at Day Street as described above. These drainage devices are shown on the existing condition hydrology map. The 2-year, 10-year and 100-year peak flow rates are approximately 2.0 cfs, 4.0 cfs and 7.0 cfs, respectively. AES software was used to calculate all rational method peak flow rates.

The southeastern 2.95 acres of the site drains to Alessandro Blvd. The respective 2-year, 10-year, and 100-year peak flow rates are approximately 1.0 cfs, 2.0 cfs and 3.5 cfs. AES software was used to calculate all rational method peak flow rates.

Please see Appendix B for the Existing Condition Hydrology Calculations and Appendix D for the Existing Condition Hydrology Map.

### Proposed Condition

Runoff from the eastern portion of the building and the eastern vehicle parking (nodes 100-101) will be collected in the southeast corner of the site. A private storm drain, line A, will convey the runoff westerly towards the truck yard. The runoff from the north drive aisle and vehicle parking will be collected in a proposed catch basin in the northwest corner of the site (nodes 200-201). A proposed storm drain, line B, will convey the runoff southerly. The storm drain will continue southerly and collect the runoff from the remaining portions of the site (nodes 202, 300-401). The 2-year, 10-year and 100-year peak flow rates are approximately 7.4 cfs, 12.3 cfs and 19.1 cfs, respectively. AES software was used to calculate all rational method peak flow rates.

Please see Appendix B for the Proposed Condition Hydrology Calculations and Appendix D for the Proposed Condition Hydrology Map.

### Detention

The site will limit discharge to existing conditions flow rates. The peak flow will be detained in the truck yard. The truck yard provides 0.54 ac-ft of storage. The flow will be limited to 7.7 cfs which will require approximately 8.5" of ponding in the truck yard. The limits of ponding elevation is about 1553.70, covering an area of approximately 18,430 square feet. Preliminary detention calculations were determined with Flood Hydrograph Routing Program, CIVILCADD/CIVILDESIGN.

Q-discharge at each incremental depth is calculated using the orifice equation, where hydraulic head "H" is assumed to be the surface ponding depth. Storm drain pipe sizes and hydraulics will be determined during the final design to limit the proposed 100-year site discharge to the required amount.

Please see Appendix C for Detention Calculations.

### Public Storm Drain

A public storm drain will be proposed to collect the runoff from the existing catch basins in Sherman Avenue. Then it will continue westerly towards Day Street., where it will turn south. It will continue southerly collecting the runoff from the proposed catch basins

in Day Street (catch basins will replace the existing under sidewalk drains). At Alessandro, it will turn westerly continuing towards Old 215 Frontage Road. It will continue north in Old 215 Frontage Road where it will connect to a bubbler manhole which will discharge to the existing ditch along the east side of the road.

The proposed catch basin along the west side of Day Street will continue to have an outlet to the existing ditch in addition to the connection to the proposed storm drain system described above. The existing ditch will act as a secondary outlet for the storm drain system. Riverside County Flood Control and Water Conservation District (RCFC&WCD) does not have any records of existing facilities in the Old 215 Frontage Road area. However, there are clearly existing drainage devices in the ditch along the east of Old 215 Frontage Road and along the center median. These appear to convey runoff westerly towards the 215 Freeway. This will be confirmed with RCFC&WCD and in the field during final design.

### Conclusion

In the existing condition the site discharged approximately 7.75 cfs for a 100-year peak flow rate. The proposed site will discharge approximately 18.9 cfs, without detention, for a 100-year peak flow rate. The truck yard will provide the required detention to limit the flow rate to the existing condition. Therefore, the development of the project will not have an adverse effect on the downstream facilities.

See table below for summary of peak flow rates.

Storm Frequency	Existing Q (cfs)	Proposed Q (cfs)	Discharged (with detention) Q (cfs)
2-year	3.0	7.4	3.2
10-year	6.0	12.3	5.3
100-year	10.5	19.1	7.7

### Water Quality

To meet Hydrologic Conditions of Concerns (HCOC) requirements, runoff in the proposed condition will be limited to 105% of the existing condition 2-year storm event. The mitigation volume will be retained onsite using underground infiltration chambers.

The mitigation volume required is approximately 41,915 cf,  $[(49,967 \times 0.95) - 5,554]$ . The proposed underground infiltration chambers will retain a total of 42,085 cf of storm water volume.

### Methodology

Hydrology calculations were computed using Riverside County rational method program (by AES software). The soil type is B per Riverside County Hydrology Manual.

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 290  
 Hydrograph time unit = 5.000 (Min.)  
 Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)  
 Initial basin storage = 0.00 (Ac.Ft)  
 Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O^2*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)
0.000	0.000	0.000	0.000	0.000
0.200	0.340	6.500	0.318	0.362

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 290  
 Hydrograph time unit = 5.000 (Min.)  
 Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)  
 Initial basin storage = 0.00 (Ac.Ft)  
 Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	$(S-O^2 \cdot dt/2)$ (Ac.Ft)	$(S+O^2 \cdot dt/2)$ (Ac.Ft)
0.000	0.000	0.000	0.000	0.000
