4.2.6 Geology and Soils

Evaluation of potential geologic and soil-related impacts were based on the *Geological Reconnaissance Evaluation, Blythe Mesa Solar Project, Blythe, California*, prepared by Ninyo & Moore (refer to Appendix E). This section discusses geologic hazards. While the impacts of the existing environment on the Project and Alternatives are not encompassed by CEQA or NEPA, this section discusses those issues to assist decision-makers in addressing regulatory concerns. It also discusses potential impacts of the Project and Alternatives, and describes the methods used to determine the impacts of the Project, and measures to mitigate (i.e., avoid, minimize, rectify, reduce, eliminate, or compensate for) impacts accompany each impact discussion.

Methodology for Analysis

The Project's geotechnical investigation included review of pertinent background data, including geotechnical reports, topographic maps, geologic data, fault maps, and aerial photographs. A geological reconnaissance was conducted at the Project area, which included observation and photo-documentation of existing geologic conditions across the site and an evaluation of possible geologic hazards that may impact the proposed Project. Site-specific subsurface exploration, laboratory testing, and engineering analysis was not conducted in preparation of the geotechnical report prepared for the proposed Project. However, subsurface data was obtained from nearby borings during previous geologic reconnaissance for the Blythe Energy Center, and included in this analysis.

It is assumed that geotechnical design considerations for future structures are in accordance with applicable requirements of the 2010 California Building Code (CBC), the County of Riverside County Code (for the portion of the Project under County jurisdiction), the City of Blythe Municipal Code (for the portion of the Project under City jurisdiction), the International Building Code (IBC) (for the portion of the Project under BLM jurisdiction), and any applicable building and seismic codes in effect at the time the grading plans are approved.

For ease of reference, both potential impacts of the Project and Alternatives on the environment and potential impacts of the existing environment on the Project are both referred to as impacts of the Project and Alternatives, and measures to ameliorate both types of impacts are referred to as mitigation measures. However, as noted below, CEQA and NEPA address only the impacts of the Project and Alternatives on the environment and not impacts of the environment on the Project and Alternatives. Impacts of the environment on the Project and Alternatives are nonetheless addressed to assist decision-makers in addressing regulatory concerns.

CEQA Significance Criteria

The criteria used to determine the significance of potential geology and soils and mineral resources impacts are based on Appendix G of the CEQA Guidelines. The Project would result in a significant impact under CEQA related to geology, soils, and mineral resources if it would:

GEO-1) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:

- *a) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault.*
- *b) Strong Seismic ground shaking.*
- *c) Seismic-related ground failure, including liquefaction.*
- *d) Landslides.*

GEO-2) Result in substantial soil erosion or the loss of topsoil.

GEO-3) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.

GEO-4) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life and property.

GEO-5) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

MR-1) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.

MR-2) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

The following additional significance criteria from the County of Riverside CEQA Environmental Assessment Form are used in the analysis. A project could have potentially significant impacts if it would:

GEO-6) Be subject to geologic hazards, such as seiche, mudflow, or volcanic hazard.

GEO-7) Change topography or ground surface relief features.

GEO-8) Create cut or fill slopes greater than 2:1 or higher than 10 feet.

GEO-9) Result in grading that affects or negates subsurface sewage disposal systems.

GEO-10) Change deposition, siltation, or erosion that may modify the channel of a river or stream or the bed of a lake.

GEO-11) Result in any increase in water erosion either on- or off-site.

GEO-12) Be impacted by or result in an increase in wind erosion and blowsand, either on- or off-site.

GEO-13) Be an incompatible land use located adjacent to a State classified or designated area or existing surface mine.

GEO-14) Expose people or property to hazards from proposed, existing or abandoned quarries or mines.

NEPA Requirements

The potential effects of the proposed Project and Alternatives are analyzed in relation to the baseline conditions (described in Chapter 3). Potential direct and indirect impacts of the Project and Alternatives are analyzed below and discussed as construction-related, operation- and maintenance-related, and decommissioning effects.

Applicable Best Management Practices

As part of the Project and Alternatives, the following applicable BMPs would minimize the environmental impacts to geology and soils. The full BMPs have been detailed below (see also Table 2-4 in Chapter 2) and are further referenced (by number) within the impact discussion.

NUMBER	BMP DESCRIPTION
BMP-1	**Drainage, Erosion, and Sedimentation Control Plan**. As part of the County of Riverside's Conditional Use Permit (CUP) requirements, a Drainage, Erosion, and Sedimentation Control Plan would be developed for the Project. The plan would address the drainage, erosion, and sediment control requirements to support all activities associated with construction, operation, maintenance, and decommissioning of the Project. For example, any stockpiles created would be kept on-site, with an upslope barrier in place to divert runoff. Stockpiles would be sprayed with water, covered with tarpaulins, and/or treated with appropriate dust suppressants, especially in preparation for high wind or storm conditions. Certified weed-free straw bale barriers would be installed to control sediment in runoff water; straw bale barriers would be installed only where sediment-laden water can pond, thus allowing the sediment to settle out. Topsoil from the site would be stripped, stockpiled, and stabilized before excavating earth for facility construction. Topsoil would be segregated and spread on freshly disturbed areas to reduce color contrast and aid rapid revegetation.
BMP-2	**Stormwater Pollution Prevention Plan.** In compliance with requirements of the National Pollutant Discharge Elimination System (NPDES) permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and prepared for the Project to ensure that protection of water quality and soil resources is consistent with County and State regulations. The plan would identify site surface water runoff patterns and include measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Project area and Project-related construction areas, and would also include measures for non-stormwater discharge and waste management. The SWPPP would cover all activities associated with the construction of the Project, including clearing, grading, and other ground disturbance such as stockpiling or excavation erosion control. The plan would prevent off-site migration of contaminated stormwater, changes in pre-Project storm hydrographs, or increased soil erosion.
BMP-3	**Fugitive Dust Abatement Plan.** As required by the Mojave Desert Air Quality Management District Rule 403, a Fugitive Dust Abatement Plan would be prepared to address fugitive dust emissions during Project construction, operation, maintenance, and decommissioning. The plan would include measures to minimize fugitive dust emissions from wrecking, excavation, grading, clearing of land, and solid waste disposal operations, and would take every reasonable precaution to prevent visible particulate matter from being deposited upon public roadways as a direct result of operations. During construction, all unpaved roads, disturbed areas (e.g., areas of scraping, excavation, backfilling, grading, and compacting), and loose materials generated during Project construction activities would be watered as frequently as necessary to minimize fugitive dust generation. However, the amount of water will be minimized each time to prevent temporarily ponding water that may occur as a result of the fugitive dust plan. In water-deprived locations, water spraying would be limited to active disturbance areas only, and non-water-based dust control measures would be implemented in areas with intermittent use or use that is not heavy, such as stockpiles or access roads. Alternatively, chemical dust suppressants or durable polymeric soil stabilizers could be used. The dust suppression measures would consider the sensitivity of wildlife to the windborne dispersal of fugitive dust containing dust suppressants and the potential impact on future reclamation.
BMP-11	**Project structures, gen-tie line, and building surfaces.** Project facilities would be sited to ensure that there is adequate space (i.e., setbacks of no less than 100 feet) between solar facilities and natural washes. These setbacks would preserve and maintain the natural washes' hydrological functions. The color and finish of Project structure and building surfaces that are visible to the public will be designed to ensure minimal visual intrusion, contrast, and glare. Grouped structures will be painted the same color to reduce visual complexity and color contrast. Solar panel backs will be color-treated to reduce visual contrast with the landscape setting. Materials, coatings, or paints having little or no reflectivity will be used wherever possible. The visual color contrast of graveled surfaces will be reduced with approved color treatment practices.

Alternative 1: Proposed Project

Analysis of Direct and Indirect Impacts

Construction

The Project area is relatively flat and slopes gently toward the southeast. The PV solar panels proposed for the site can operate on slopes up to nine percent in all directions; therefore, no mass grading would be required. Some of the parcels where facilities and arrays would be located would require light grubbing. Access roads would require minimal grading. After grubbing and light grading, construction of staging

areas would occur. During the three-year construction period, approximately 1,354 acre-feet (AF) of water (or about 451 AF per year) would be required for each year of construction for dust suppression, concrete manufacturing, and fire safety (POWER 2013b).

Demolition of existing site structures (e.g., storage buildings in citrus grove and three residences on the Project area) would be required prior to construction of proposed Project components. Installation of the electrical collection system would require excavations to a depth of about three feet for underground electrical circuits, inverter and switchgear enclosure foundations, and transformer foundation. The O&M building foundations would also be excavated to a depth of about three feet. The O&M buildings would include bathroom facilities serviced by a private septic system and would be designated occupancy classification U[5].

The gen-tie line facilities would include a set of double-circuit tubular steel poles (only one circuit would be strung and the other circuit would be vacant) that are 85 to 125 feet tall with an average tower-to-tower span length of 500 to 800 feet (see Figure 2-7). Structure heights and corresponding span lengths would meet Federal Aviation Administration (FAA) requirements for the nearby Blythe Airport. The suspension poles would typically be four to six feet in diameter. At angle or dead-end points along the gen-tie path, larger poles (approximately six to ten feet in diameter) would be required. The poles would be directly embedded in the soil or set in concrete foundations approximately four to six feet in diameter and 20 to 30 feet deep. Concrete foundations, if used, would typically extend one foot laterally beyond the base of the poles, adding up to two feet to the overall diameter of the permanent footprint of each pole location. Any native soil not used to backfill would be spread around the poles. Although not expected, the use of a backhoe could be necessary in some instances because of specific geologic conditions. Laydown areas would be required for construction of the gen-tie line; ideally, an already disturbed area would be used for this purpose, which will be determined at the onset of construction. The ground disturbing activities related to the preparation for the laydown areas would involve grubbing and some possible light grading. Temporary access roads to each structure would be 12 to 16 feet wide, covered with eight inches of gravel over compacted sub-grade, and within the proposed ROW.

Seismic Hazards

The solar facility, as with the entire Southern California region, is subject to secondary effects from earthquakes. As shown in Table 3.2.6-1, Principal Active Faults, in Chapter 3, the closest active fault to the solar facility is the Brawley Seismic Zone, approximately 57.9 miles from the solar facility. As such, the solar facility would not be within a designated Alquist-Priolo Fault Zone, and there are no known active or potentially active faults underlying the solar facility. Therefore, the potential for surface ground rupture and lurching or cracking of the ground surface at the solar facility is considered low.

While the solar facility would not be within a designated Alquist-Priolo Fault Zone and there are no known active or potentially active faults underlying the Solar facility, severe ground-shaking along the faults identified in Table 3.2.6-1 could result in damage to site structures, including the PV solar panels, inverters/transformers, interior collection power lines, on-site substations, and O&M buildings, as well as the 8.4-mile gen-tie line on BLM-managed lands. Implementation of the proposed Project would not change the intensity of ground shaking that would occur on the solar facility during a seismic event. Potential effects to the solar facility and associated structures related to ground shaking would be reduced through compliance with State and local regulations and standards and established engineering procedures. Future structures would be designed in accordance with the County of Riverside and City of Blythe Building Codes and the most recent CBC and IBC requirements, and would be consistent with the recommendations outlined in a final design level geotechnical report prepared for the proposed Project.

[5] Utility and Miscellaneous Group U: uses intended for structures of an accessory character and not classified in any specific occupancy, 2009 International Building Code, Chapter 3.

Liquefaction/Lateral Spreading

Liquefaction and associated lateral spreading is the phenomenon in which loosely deposited, saturated granular soils (located below the water table), with clay contents (particles less than 0.005 millimeter) of less than 15 percent, a liquid limit of less than 35 percent, and natural moisture content greater than 90 percent of the liquid limit undergo rapid loss of shear strength due to development of excess pore pressure during strong earthquake-induced ground shaking. Ground shaking of sufficient duration results in the loss of grain-to-grain contact due to rapid rise in pore water pressure, and it eventually causes the soil to behave as a fluid for a short period of time. Liquefaction generally occurs in saturated or near-saturated cohesionless soils at depths shallower than approximately 50 feet below grade. Factors known to influence liquefaction potential include composition and thickness of soil layers, grain size, relative density, groundwater level, degree of saturation, and both intensity and duration of ground shaking.

The RCGP, Figure S-3, indicates the site is mapped within a zone described as “moderately susceptible” to liquefaction for areas with deep groundwater. However, borings conducted at Project area indicated that the groundwater is at a depth greater than 50 feet. Therefore, due to the lack of shallow groundwater, liquefaction and seismically induced settlement at the Project area are unlikely.

Landslides/Slope Stability

Landslides may be induced by strong vibratory motion produced by earthquakes. Research and historical data indicate that seismically induced landslides tend to occur in weak soil and rock on sloping terrain. Based on review of the RCGP Figure S-4, on the relatively gentle slopes in areas underlain by alluvium, and on the dense nature of the older alluvium, the potential for seismically induced landslides and debris flows at the site is considered low. In addition, no landslides, debris flows, or rock falls are known to be present on the site.

Preliminary Project plans indicate that the Project boundary would be adjacent to the descending bluff along the eastern site boundary. A review of the RCGP Figure S-5 indicates that this slope has a low to locally moderate susceptibility to seismically induced landslides and rockfalls. However, proposed Project improvements are not anticipated to be constructed on or near the bluff slope. Because the solar facility would be on relatively flat terrain and not subject to landslides, and Project components would not be on or near the bluff slope, the potential for seismically induced landslides and debris flows at the site is considered low.

Soil Erosion

In general, erosion refers to the process by which soil or earth material is loosened or dissolved and removed from its original location. Erosion can occur by varying processes and may occur in the Project area where bare soil (or rock) is exposed to wind or moving water (both rainfall and surface runoff). The processes of erosion are generally functions of material type, terrain steepness, rainfall or irrigation levels, surface drainage conditions, wind velocity, and general land use. According to the geotechnical report prepared for the Project, surface soils on the solar facility generally comprise sand and gravels. Based on the gentle gradients across the site, the potential for water erosion is low. However, portions of the Project area situated along the eastern boundary may be subject to water erosion down the bluff face.

According to the geotechnical report, eolian deposits (wind deposited) and areas of deflation (coarse sand and gravel concentrated due to wind erosion of the fine-grain silts and sands) are present across portions of the Project area. The presence of eolian sand across the Project area indicates that the Project area has been historically subject to moderate to relatively high winds. Based on review of the RCGP Figure S-8, the solar facility and the gen-tie line are moderately to highly susceptible to wind erosion.

Construction of the Project would require ground-disturbing activities, including solar panel installation, substation and O&M buildings and associated septic systems, installation of the gen-tie line in the transmission corridor, and construction of access roads. Disturbed soils accelerate erosion and increase sediment in stormwater runoff to receiving waters, causing increased turbidity and sedimentation.

The soils on the solar facility site would be subject to wind erosion during construction activities. The proposed Project would implement fugitive dust control measures as required under MDAQMD Rule 403 as a matter of regulation.

Subsidence

Subsidence is characterized as a settlement of the ground surface relative to surrounding areas and generally occurs where deep alluvial deposits are present in valley areas. Subsidence in alluvial valley areas is typically associated with groundwater withdrawal or other fluid withdrawal from the subsurface, such as of oil or natural gas. Extraction of these geologic components can cause subsidence, which can result in the development of surface ground cracks and fissures, particularly near valley margins. Cracks and earth fissures can cause damage to improvements, including roads, transmission lines, foundations, and structures. The RCGP Figure S-7 designates the Project area as a "Susceptible Area." Based on the geotechnical report's site reconnaissance, no ground cracks or earth fissures were observed. However, the solar generation site and gen-tie ROW are generally covered with a mantle of eolian sand or active or plowed agricultural fields that may conceal underlying cracks or fissures. Subsidence can also occur as a result of placement of new loads such as new structures or other improvements unless the underlying soils are given appropriate site preparation.

Based on the geotechnical report, the proposed Project is geotechnically feasible. Prior to final Project design and construction, and to address regulatory concerns rather than impacts of the Project on the environment, a site-specific subsurface geotechnical evaluation would be required to assess the potential for subsidence and/or the presence of earth fissures underlying the solar facility.

Based on the geotechnical report, the underlying alluvium is expected to consist of loose to dense layers of silty sands and gravel. Therefore, some settlement of the loose soils underlying the surface is possible.

Expansive Soil

Expansive soils generally result from specific clay minerals that have the capacity to shrink or swell in response to changes in moisture content. Based on review of regional geologic maps and geologic reconnaissance, the deposits underlying the solar generation site and gen-tie ROW consist of granular alluvial deposits (sand and gravel). It is expected that grading recommendations would likely be specified as granular. Therefore, the potential for near-surface expansive soils to adversely affect proposed improvements at the solar facility is considered low. However, the geotechnical report recommends that, prior to final Project design and construction, a site-specific subsurface evaluation be performed to assess the potential for expansive soils so that, to address regulatory concerns rather than impacts of the Project on the environment, appropriate site-specific structural design techniques for both the solar array site and the gen-tie line can be implemented as necessary.

Septic Tanks/Alternative Waste Water Disposal Systems

On-site Wastewater Treatment Systems or Advanced Treatment Units would be installed to treat domestic sewage (non-hazardous liquid waste) from the O&M buildings on-site. Prior to the issuance of a building permit, the Project shall be required to obtain permit approval from DEH to install an On-site Wastewater Treatment Systems or ATU. Additional soils percolation testing shall be required at time of building plan check submittal.

Mineral Resources

The Project area and area in the vicinity of the gen-tie line are not used for mineral production, nor is it under claim, lease, or permit for the production of locatable, leasable, or salable minerals or mineral materials. However, the solar facility site and gen-tie line corridor are underlain by sand and gravel, which potentially could represent a source of saleable minerals or mineral materials if there is a sufficient local demand for construction aggregate.

The fact that the Project would make land unavailable for the life of the Project represents minor potential for an adverse impact on mineral resources for several reasons:

1) Deposits of similar age and lithology that are likewise potential sources of sand and gravel are estimated to underlie a large portion of eastern Riverside County.
2) There is no information to indicate that the sand and gravel underlying the site is unique, of higher quality, or any more marketable than other similar deposits that are widespread throughout eastern Riverside County.
3) There is an existing producer of sand and gravel close to the Blythe Landfill, which likely would be able to serve local future demand for sand and gravel.
4) Following the decommissioning of the Project, the land previously occupied by the Project would again be as available for exploration or production of aggregate construction materials as it is currently.

The Project and gen-tie line would not block or otherwise impair access to a major public roadway. The presence of the Project would not prevent permitted prospectors or owners of mineral leases in the surrounding region from accessing areas outside the footprint of the Project, such as the McCoy Mountains, because there are other routes available to access the surrounding mountains.

Seiche, Mudflow or Volcanic Hazard

There are no bodies of constant water in proximity to the Project area, and the site is not near the shoreline or within 50 feet of sea level; therefore, hazards from a seiche or tsunami are considered to be negligible. There are no hillside areas within the Project vicinity that would generate mudflow. In addition, no known active volcanic features occur in the Project area.

Operation and Maintenance

As stated above, the solar facility would be in a seismically active region, and people and structures associated with the Project could be exposed to seismic ground shaking and subsequent seismic-related ground failure.

Operation and maintenance activities could include daily operations and routine maintenance activities, such as PV panel washing, which are anticipated to occur up to two times per year, if necessary, to optimize output. Cleaning of the panels would require up to 345 AF/year[6]. Cleaning operations would not alter the drainage patterns on-site, and would not lead to a substantial increase in erosion or loss of topsoil. Any surface water runoff resulting from permanent Project features is not anticipated to influence surface runoff in a manner that would result in erosion or loss of topsoil.

Operation and maintenance vehicles would include trucks (pickup and flatbed), forklifts, and loaders for routine and unscheduled maintenance and water trucks for solar panel washing. Large, heavy-haul transport equipment may be brought to the solar facility infrequently for equipment repair or replacement. Due to the infrequent and temporary nature of operation and maintenance activities, no substantial erosion or loss of topsoil is anticipated.

The O&M buildings would include bathroom facilities serviced by a private septic system and would be designated occupancy classification U. The septic system would be placed in soils capable of adequately supporting the septic system as required by local permitting; therefore, operation of the septic system would not adversely affect soil resources.

Decommissioning

Decommissioning and dismantling activities could include recovering the silicon from the solar panels, reselling the aluminum, and recycling the glass. Other components of the solar installation, such as the

[6] The operational water needs would be further refined pre-construction.

tracker structures and mechanical assemblies, can also be recycled, as they are made from galvanized steel. Equipment such as drive controllers, inverters, transformers, and switchgear can be either reused or their components recycled. The equipment pads would be made of concrete, which can be crushed and recycled. Underground conduit and wire can be removed by uncovering trenches and backfilling when done. The electrical wiring would be made of copper and/or aluminum and can be reused or recycled, as well. The 230 kV gen-tie line would also be dismantled and its material recycled. Because areas subject to decommissioning would have been disturbed during construction, no additional direct (at the time of decommissioning) or indirect (in the future after decommissioning is completed) effects to geological/soil resources within the Project area are anticipated during decommissioning of the proposed Project.

As stated above, the solar facility and gen-tie line would be in a seismically active region, and people and structures could be exposed to seismic ground shaking and subsequent seismic-related ground failure. These potentially significant impacts have been addressed above, and the regulatory requirements put in place prior to final Project design and construction would minimize any potential effects to geological/soil resources during decommissioning activities.

Application of CEQA Significance Thresholds

The solar facility would be in a seismically active region, and people and structures could be exposed to seismic ground shaking. In addition, impacts related secondary seismic effects, including liquefaction and liquefaction-induced settlement, may be potentially significant. However, geotechnical design considerations for structures shall be in accordance with applicable requirements of the 2010 CBC, the County of Riverside Municipal Code, and any applicable building and seismic codes in effect at the time the grading plans are approved. Additionally, with implementation of Mitigation Measure Geology-1, impacts would be considered less than significant during construction, operation, maintenance, and decommissioning.

GEO-1) Would the Project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:

a) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault.
b) Strong Seismic ground shaking.
c) Seismic-related ground failure, including liquefaction.
d) Landslides.

The solar facility would be in a seismically active region, and people and structures could be exposed to seismic ground shaking. Implementation of Mitigation Measure Geology-1 requires subsequent geotechnical work to determine site specific parameters for foundation design and engineering. Implementation of Mitigation Measure Geology-3 would require the removal of loose soil layers and replacement with compacted fill or specialized foundation design, including the use of deep foundation systems, if appropriate, to help support structures. With implementation of Mitigation Measures Geology-1 and Geology-3, impacts would be reduced to less than significant levels.

GEO-2) Would the Project result in substantial soil erosion or the loss of topsoil?

Implementation of the proposed Project would result in both short-term, construction-related wind and water erosion related to Project operation and maintenance activities if not managed appropriately. Cleaning operations would not alter the drainage patterns on-site, and would not lead to a substantial increase in erosion or loss of topsoil. Any surface water runoff resulting from permanent Project features is not anticipated to influence surface runoff in a manner that would result in erosion or loss of topsoil. As part of the proposed Project, a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) would be implemented, which would identify site surface water runoff patterns; develop mitigation measures that prevent excessive, unnatural

soil deposition and erosion throughout and downslope of the Project area and Project-related construction areas; minimize impacts related to soil erosion during construction; and protect soil resources consistent with City, County, and State regulations. Also as part of the proposed Project, a SWPPP (BMP-2) would be implemented, which would prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Project area and Project-related construction areas, and would also include measures for non-stormwater discharge and waste management. Impacts would be less than significant for construction, operation, maintenance, and decommissioning.

GEO-3) Would the Project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

The underlying alluvium is expected to consist of loose to dense layers of silty sands and gravel, and some settlement of the loose soils underlying the surface is possible. This potentially significant impact would be reduced to a level considered less than significant with implementation of Mitigation Measures Geology-1 through Geology 4.

Seismic ground-shaking impacts resulting in on- or off-site landslides and lateral spreading are considered less than significant during construction, operation, maintenance, and decommissioning, and no mitigation measures are recommended.

GEO-4) Would the Project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life and property?

The potential for expansive soils to be encountered on the solar facility site and in the vicinity of the gen-tie line is considered low; however, implementation of Mitigation Measure Geology-4 would reduce any significant impacts during construction to a level considered less than significant. No impacts are anticipated during operation and decommissioning, as Project design and construction would minimize any potential effects to geological/soil resources.

GEO-5) Would the Project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

The proposed Project would require the use of a septic tank system on the solar facility site to treat domestic wastewater from the two O&M buildings. Preliminary soils percolation testing (POWER Engineers: 123128 Percolation Test Report dated October 5, 2012) showed soils ranging from poorly graded, fine to medium grained, loose to medium dense sand with a trace of silt indicating that the proposal for an on-site wastewater treatment system or advanced treatment unit is feasible. Construction-related impacts from the septic system would be considered less than significant with implementation of Mitigation Measure Geology-3. No operation or decommissioning impacts are anticipated.

GEO-6) Would the Project be subject to geologic hazards, such as seiche, mudflow, or volcanic hazard?

There are no bodies of constant water in proximity to the Project area, and the site is not near the shoreline or within 50 feet of sea level; therefore, hazards from a seiche or tsunami are considered to be negligible. There are no hillside areas within the Project vicinity that would generate mudflow. In addition, no known active volcanic features occur in the Project area. No impacts would occur and no mitigation is recommended.

GEO-7) Would the Project change topography or ground surface relief features?

The Project boundary would be adjacent to the descending bluff along the eastern site boundary. The proposed Project improvements are not anticipated to be constructed on or near the bluff slope. Since most of the site has nearly level to gently sloping topography, no mass grading would be required. Because the solar facility would be on relatively flat terrain and

Project components would not be on or near the bluff slope, implementation of the proposed Project would not significantly change site topography or ground surface relief features. Construction would not substantially grade, excavate, or cut and fill slopes greater than 2:1 or higher than 10 feet. No impact.

GEO-8) Would the Project create cut or fill slopes greater than 2:1 or higher than 10 feet?

As discussed above in GEO-7, the proposed Project would be located on relatively flat terrain and would not be located on or near the bluff slope; therefore no significant change in site topography or ground surface relief features. No impact.

GEO-9) Would the Project result in grading that affects or negates subsurface sewage disposal systems?

Implementation of the Project would require the removal of three residences within the Project area that may have septic systems to treat domestic wastewater. These septic systems would be removed prior to Project construction under permit with the County of Riverside, Department of Environmental Health. In addition, the proposed Project would not require extensive grading. Impacts would be less than significant.

GEO-10) Would the Project change deposition, siltation, or erosion that may modify the channel of a river or stream or the bed of a lake?

Although on-site grading would be minimized, construction of the proposed facilities, including roads, fencing, and solar arrays, could result in deposition, siltation, or erosion to on-site drainages; such changes could result in altered runoff and erosional processes on-site, which could lead to increased erosion and sedimentation on-site or downstream. Project construction, operation, maintenance, and decommissioning may result in potentially significant impacts to surface and stormwater quality. With implementation of Mitigation Measures Hydrology-1 through Hydrology-4 in Section 4.2.9, *Hydrology and Water Quality*, impacts would be reduced to less than significant levels.

GEO-11) Would the Project result in any increase in water erosion either on- or off-site?

See GEO-6 above. The soils on the Project area would be subject to wind and water erosion during construction activities. The proposed Project would implement fugitive dust control measures as required under MDAQMD Rule 403 as a matter of regulation. Further, as part of the proposed Project, a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) would be implemented, which would minimize impacts related to water erosion during construction. The Drainage, Erosion, and Sedimentation Control Plan would protect soil resources consistent with City, County, and State regulations. The plan will identify site surface water runoff patterns and develop mitigation measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Project area and Project-related construction areas. Also as part of the proposed Project, a SWPPP (BMP-2) would be implemented, which would prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Project area and Project-related construction areas, and would also include measures for non-stormwater discharge and waste management. The SWPPP would also prevent off-site migration of contaminated stormwater, changes in pre-Project storm hydrographs, or increased soil erosion. Impacts would be less than significant; no mitigation is recommended.

GEO-12) Would the Project be impacted by or result in an increase in wind erosion and blowsand, either on- or off-site?

See analysis for GEO-11 above. Impacts would be less than significant

MR-1) Would the Project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Based on the RCGP Figure OS-5, Mineral Resource Area, the proposed Project would be within the State of California-designated Mineral Resources Zone (MRZ) Classification of MRZ-

4, which is defined as an area where there is not enough information available to determine the presence or absence of mineral deposits. Therefore, the Project would not result in the loss of availability of a known mineral resource classified by the State, and there would be no impact.

MR-2) Would the Project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

The proposed Project area is not delineated in the PVVAP or RCGP as a locally important mineral resource recovery site; therefore, the loss of availability of a delineated locally important mineral resource recovery site would not occur. There would be no impact.

MR-3) Would the Project be an incompatible land use located adjacent to a State classified or designated area or existing surface mine?

Because there are other major roadways within the Project area, the Project would not prevent permitted prospectors or owners of mineral leases in the surrounding region from accessing areas outside the footprint of the Project, such as the McCoy Mountains. Therefore, the Project would not be an incompatible land use with a State-classified or designated area for mining operations. No impact would occur.

MR-4) Would the Project expose people or property to hazards from proposed, existing or abandoned quarries or mines?

The Project area is not used for mineral production, nor is it under claim, lease, or permit for the production of locatable, leasable, or salable minerals or mineral materials. The Project would not expose people or property to hazards from proposed, existing, or abandoned quarries or mines. No impact would occur.

Alternative 2: No Project Alternative

Alternative 2, the No Project Alternative, assumes that the Project would not be constructed. Under this Alternative, no federal approval would be required, as no BLM-managed land would be crossed. Continuation of existing land uses would be expected based on the current General Plan and land use ordinance designations. Potential geologic resources in the affected environment, including highly erosion-sensitive soils, would not be impacted by construction, operation and maintenance, and decommissioning of the Project.

The baseline conditions associated with geologic and soil resources would continue under the No Project Alternative.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Alternative 3's gen-tie line would cause the same types of geologic and soil resource-related impacts as the proposed Project's gen-tie line, although the location of the impacts associated with this Alternative would be shifted to the north relative to the proposed Project's gen-tie line. Alternative 3's gen-tie line would be slightly longer than the proposed Project's gen-tie line. Consequently, activities associated with construction, operation, maintenance, and decommissioning of this Alternative would affect or occupy a slightly larger area of potential geologic and soil resources. Nonetheless, there would be no substantial difference between impacts related to Alternative 3's gen-tie line and the proposed Project's gen-tie line.

Application of CEQA Significance Thresholds

GEO-1) Would Alternative 3 expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:

a) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault.
b) Strong Seismic ground shaking.
c) Seismic-related ground failure, including liquefaction.
d) Landslides.

The solar facility would be in a seismically active region, and people and structures could be exposed to seismic ground shaking. Potentially significant impacts related to secondary seismic effects, including liquefaction and liquefaction-induced settlement, would be reduced to less than significant with implementation of Mitigation Measure Geology-1.

GEO-2) Would Alternative 3 result in substantial soil erosion or the loss of topsoil?

Implementation of Alternative 3 would result in both temporary, construction-related wind and water erosion and wind and water erosion related to operation and maintenance over the life of Alternative 3 if not managed appropriately. However, as part of Alternative 3, a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) and SWPPP (BMP-2) would be implemented. The Drainage, Erosion, and Sedimentation Control Plan would protect soil resources consistent with City, County, and State regulations. The plan will identify site surface water runoff patterns and develop mitigation measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Alternative 3 site and Alternative 3-related construction areas. Impacts would be less than significant. Impacts would also be less than significant during decommissioning.

GEO-3) Would Alternative 3 be located on a geologic unit or soil that is unstable, or that would become unstable as a result of Alternative 3, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

The underlying alluvium is expected to consist of loose to dense layers of silty sands and gravel, and some settlement of the loose soils underlying the surface is possible. This potentially significant impact would be reduced to a level considered less than significant with implementation of Mitigation Measure Geology-1.

Seismic ground-shaking impacts resulting in on- or off-site landslides and lateral spreading are considered less than significant during construction, operation, maintenance, and decommissioning, and no mitigation measures are recommended.

GEO-4) Would Alternative 3 be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life and property?

The potential for expansive soils to be encountered on the solar facility site is considered low; however, implementation of Mitigation Measure Geology-1 would reduce any significant impacts during construction to a level considered less than significant. No impacts are anticipated during operation and decommissioning, as Alternative 3 design and construction would minimize any potential effects to geologic and soil resources.

GEO-5) Would Alternative 3 have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Alternative 3 would require the use of a septic tank system on the solar facility site to treat domestic wastewater from the two O&M buildings. Preliminary soils percolation testing (POWER Engineers: 123128 Percolation Test Report dated October 5, 2012) showed soils ranging from poorly graded, fine to medium grained, loose to medium dense sand with a trace of silt indicating that the proposal for an on-site wastewater treatment system or advanced treatment unit is feasible. Construction-related impacts from the septic system would be considered less than significant with implementation of Mitigation Measure Geology-2. No operation or decommissioning impacts are anticipated.

GEO-6) Would Alternative 3 be subject to geologic hazards, such as seiche, mudflow, or volcanic hazard?

There are no bodies of constant water in proximity to the Alternative 3 site, and the site is not near the shoreline or within 50 feet of sea level; therefore, hazards from a seiche or tsunami are considered to be negligible. There are no hillside areas within the Alternative 3 vicinity that would generate mudflow. In addition, no known active volcanic features occur in the Alternative 3 area. No impacts would occur and no mitigation is recommended.

GEO-7) Would Alternative 3 change topography or ground surface relief features?

The Alternative 3 boundary would be adjacent to the descending bluff along the eastern site boundary. Alternative 3 improvements are not anticipated to be constructed on or near the bluff slope. Since most of the site has nearly level to gently sloping topography, no mass grading would be required. Because the solar facility would be on relatively flat terrain and Alternative 3 components would not be on or near the bluff slope, implementation of Alternative 3 would not significantly change site topography or ground surface relief features. Construction would not substantially grade, excavate, or cut and fill slopes greater than 2:1 or higher than 10 feet. No mitigation is recommended.

GEO-8) Would Alternative 3 create cut or fill slopes greater than 2:1 or higher than 10 feet?

See GEO-7 analysis above.

GEO-9) Would Alternative 3 result in grading that affects or negates subsurface sewage disposal systems?

Implementation of Alternative 3 would require the removal of three residences within the Alternative 3 site that may have septic systems to treat domestic wastewater. These septic systems would be removed prior to Alternative 3 construction. In addition, Alternative 3 would not require extensive grading. Impacts would be less than significant.

GEO-10) Would Alternative 3 change deposition, siltation, or erosion that may modify the channel of a river or stream or the bed of a lake?

Although on-site grading would be minimized, construction of the proposed facilities, including roads, fencing, and solar arrays, could result in deposition, siltation, or erosion to on-site drainages; such changes could result in altered runoff and erosional processes on-site, which could lead to increased erosion and sedimentation on-site or downstream. Alternative 3's construction, operation, maintenance, and decommissioning may result in potentially significant impacts to surface and stormwater quality. With implementation of Mitigation Measures Hydrology-1 through Hydrology-4 in Section 4.2.9, *Hydrology and Water Quality*, impacts would be reduced to less than significant levels.

GEO-11) Would Alternative 3 result in any increase in water erosion either on- or off-site?

See GEO-6 analysis above. The soils on the Alternative 3 site would be subject to wind and water erosion during construction activities. Alternative 3 would implement fugitive dust control measures as required under MDAQMD Rule 403 as a matter of regulation. As previously described, a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) and SWPPP (BMP-2) would be implemented as part of Alternative 3. The Drainage, Erosion, and Sedimentation Control Plan would protect soil resources consistent with City, County, and State regulations. The plan will identify site surface water runoff patterns and develop mitigation measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Alternative 3 site and related construction areas. The SWPPP would also prevent off-site migration of contaminated stormwater, changes in pre-Project storm hydrographs, or increased soil erosion. Impacts would be less than significant. No further mitigation is required.

GEO-12) Would Alternative 3 be impacted by or result in an increase in wind erosion and blowsand, either on- or off-site?

See GEO-11 analysis above.

MR-1) Would Alternative 3 result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Based on the RCGP Figure OS-5, Mineral Resource Area, the proposed Project would be within the State of California-designated MRZ Classification of MRZ-4, which is defined as an area where there is not enough information available to determine the presence or absence of mineral deposits. Alternative 3 would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state. No impacts would occur.

MR-2) Would Alternative 3 result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

The proposed Project area is not delineated in the PVVAP or RCGP as a locally important mineral resource recovery site; therefore, the loss of availability of a delineated locally important mineral resource recovery site would not occur. Alternative 3 would not result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan. No impacts would occur.

MR-3) Would Alternative 3 be an incompatible land use located adjacent to a State classified or designated area or existing surface mine?

Because there are other major roadways within the Alternative 3 area, Alternative 3 would not prevent permitted prospectors or owners of mineral leases in the surrounding region from accessing areas outside the footprint of Alternative 3, such as the McCoy Mountains. Therefore, Alternative 3 would not be an incompatible land use with a State-classified or designated area for mining operations. No impact would occur.

MR-4) Would Alternative 3 expose people or property to hazards from proposed, existing or abandoned quarries or mines?

The Alternative 3 site is not used for mineral production, nor is it under claim, lease, or permit for the production of locatable, leasable, or salable minerals or mineral materials. Alternative 3 would not expose people or property to hazards from proposed, existing, or abandoned quarries or mines. No impact would occur.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Alternative 4 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Although the location of the impacts associated with this Alternative would be shifted to the south, Alternative 4's gen-tie line would cause the same types of geologic and soil resource-related impacts as the proposed Project's gen-tie line. Alternative 4's gen-tie line would be longer than the proposed Project's gen-tie line. Consequently, activities associated with construction, operation, maintenance, and decommissioning of this Alternative would affect or occupy a slightly larger area of potential geologic and soil resources. Nonetheless, there would be no substantial difference in impacts between Alternative 4's gen-tie line and the proposed Project's gen-tie line.

Application of CEQA Significance Thresholds

Under Alternative 4, the implementation of mitigation measures would reduce impacts to less than significant.

GEO-1) Would Alternative 4 expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:

a) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault.
b) Strong Seismic ground shaking.
c) Seismic-related ground failure, including liquefaction.
d) Landslides.

The solar facility would be in a seismically active region, and people and structures could be exposed to seismic ground shaking. Potentially significant impacts related to secondary seismic effects, including liquefaction and liquefaction-induced settlement, would be reduced to less than significant with implementation of Mitigation Measure Geology-1.

GEO-2) Would Alternative 4 result in substantial soil erosion or the loss of topsoil?

Implementation of Alternative 4 would result in both short-term, construction-related wind and water erosion, and wind and water erosion related to long-term operation and maintenance activities if not managed appropriately. Implementation of Alternative 4 would result in both temporary, construction-related wind and water erosion and wind and water erosion related to operation and maintenance over the life of Alternative 4. However, as part of Alternative 4, a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) and SWPPP (BMP-2) would be implemented. The Drainage, Erosion, and Sedimentation Control Plan would protect soil resources consistent with City, County, and State regulations. The plan will identify site surface water runoff patterns and develop mitigation measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Alternative 4 site and related construction areas. Impacts would be less than significant. Impacts would also be less than significant during decommissioning.

GEO-3) Would Alternative 4 be located on a geologic unit or soil that is unstable, or that would become unstable as a result of Alternative 4, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

The underlying alluvium is expected to consist of loose to dense layers of silty sands and gravel, and some settlement of the loose soils underlying the surface is possible. This potentially significant impact would be reduced to a level considered less than significant with implementation of Mitigation Measure Geology-1.

Seismic ground-shaking impacts resulting in on- or off-site landslides and lateral spreading are considered less than significant during construction, operation, maintenance, and decommissioning, and no mitigation measures are recommended.

GEO-4) Would Alternative 4 be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life and property?

The potential for expansive soils to be encountered on the solar facility site is considered low; however, implementation of Mitigation Measure Geology-1 would reduce any significant impacts during construction to a level considered less than significant. No impacts are anticipated during operation and decommissioning, as Alternative 4 design and construction would minimize any potential effects to geological/soil resources.

GEO-5) Would Alternative 4 have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Alternative 4 would require the use of a septic tank system on the solar facility site to treat domestic wastewater from the two O&M buildings. Preliminary soils percolation testing (POWER Engineers: 123128 Percolation Test Report dated October 5, 2012) showed soils

ranging from poorly graded, fine to medium grained, loose to medium dense sand with a trace of silt indicating that the proposal for an on-site wastewater treatment system or advanced treatment unit is feasible. Construction-related impacts from the septic system would be considered less than significant with implementation of Mitigation Measure Geology-2. No operation or decommissioning impacts are anticipated.

GEO-6) Would Alternative 4 be subject to geologic hazards, such as seiche, mudflow, or volcanic hazard?

There are no bodies of constant water in proximity to the Alternative 4 site, and the site is not near the shoreline or within 50 feet of sea level; therefore, hazards from a seiche or tsunami are considered to be negligible. There are no hillside areas within the Alternative 4 vicinity that would generate mudflow. In addition, no known active volcanic features occur in the Alternative 4 area. No impacts would occur and no mitigation is recommended.

GEO-7) Would Alternative 4 change topography or ground surface relief features?

The Alternative 4 boundary would be adjacent to the descending bluff along the eastern site boundary. Alternative 4 improvements are not anticipated to be constructed on or near the bluff slope. Since most of the site has nearly level to gently sloping topography, no mass grading would be required. Because the solar facility would be on relatively flat terrain and Alternative 4 components would not be on or near the bluff slope, implementation of Alternative 4 would not significantly change site topography or ground surface relief features. Construction would not substantially grade, excavate, or cut and fill slopes greater than 2:1 or higher than 10 feet. No mitigation is recommended.

GEO-8) Would Alternative 4 create cut or fill slopes greater than 2:1 or higher than 10 feet?

As discussed above in GEO-7, the proposed Project would be located on relatively flat terrain and would not be located on or near the bluff slope; therefore no significant change in site topography or ground surface relief features. No impact.

GEO-9) Would Alternative 4 result in grading that affects or negates subsurface sewage disposal systems?

Implementation of Alternative 4 would require the removal of three residences within the Alternative 4 site that may have septic systems to treat domestic wastewater. These septic systems would be removed prior to Alternative 4 construction in accordance with local permit requirements. In addition, Alternative 4 would not require extensive grading. Impacts would be less than significant.

GEO-10) Would Alternative 4 change deposition, siltation, or erosion that may modify the channel of a river or stream or the bed of a lake?

Although on-site grading would be minimal, construction of the proposed facilities, including roads, fencing, and solar arrays, could result in deposition, siltation, or erosion to on-site drainages; such changes could result in altered runoff and erosional processes on-site, which could lead to increased erosion and sedimentation on-site or downstream. Alternative 4's construction, operation, maintenance, and decommissioning may result in potentially significant impacts to surface and stormwater quality. With implementation of Mitigation Measures Hydrology-1 through Hydrology-4 in Section 4.2.9, *Hydrology and Water Quality*, impacts would be reduced to less than significant levels.

GEO-11) Would Alternative 4 result in any increase in water erosion either on- or off-site?

See GEO-6 above. The soils on the Alternative 4 site would be subject to wind and water erosion during construction activities. Alternative 4 would implement fugitive dust control measures as required under MDAQMD Rule 403 as a matter of regulation. As previously described, a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) and SWPPP (BMP-2) would be implemented as part of Alternative 4. The Drainage, Erosion, and Sedimentation

Control Plan would protect soil resources consistent with City, County, and State regulations. The plan will identify site surface water runoff patterns and develop mitigation measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Alternative 4 site and related construction areas. The SWPPP would also prevent off-site migration of contaminated stormwater, changes in pre-Project storm hydrographs, or increased soil erosion. Impacts would be less than significant. No further mitigation is required.

GEO-12) Would Alternative 4 be impacted by or result in an increase in wind erosion and blowsand, either on- or off-site?

See GEO-11 above. Impacts would be less than significant.

MR-1) Would Alternative 4 result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Based on the RCGP Figure OS-5, Mineral Resource Area, the proposed Project would be within the State of California-designated MRZ Classification of MRZ-4, which is defined as an area where there is not enough information available to determine the presence or absence of mineral deposits. Alternative 4 would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state. No impacts would occur.

MR-2) Would Alternative 4 result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Alternative 4 would not result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan. No impacts would occur.

MR-3) Would Alternative 4 be an incompatible land use located adjacent to a State classified or designated area or existing surface mine?

Because there are other major roadways within the Alternative 4 area, Alternative 4 would not prevent permitted prospectors or owners of mineral leases in the surrounding region from accessing areas outside the footprint of Alternative 4, such as the McCoy Mountains. Therefore, Alternative 4 would not be an incompatible land use with a State-classified or designated area for mining operations. No impact would occur.

MR-4) Would Alternative 4 expose people or property to hazards from proposed, existing or abandoned quarries or mines?

The Alternative 4 site is not used for mineral production, nor is it under claim, lease, or permit for the production of locatable, leasable, or salable minerals or mineral materials. Alternative 4 would not expose people or property to hazards from proposed, existing, or abandoned quarries or mines. No impact would occur.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Alternative 5 would include approximately 2,403 acres for the solar field. Similar to the proposed Project, 73 acres would be utilized for the 230 kV gen-tie line. In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building and would have one access

point (planned on Seeley Avenue). The Reduced Acreage Alternative would also no longer extend a 230 kV overhead gen-tie line from an on-site substation north of I-10, as this Alternative would not be developed on land north of I-10. Instead, this Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility. Alternative 5 would avoid impacts that would result from the construction, operation, maintenance, and decommissioning of a solar development north of I-10; however, continuation of existing land uses in this area would be expected based on the current General Plan and land use ordinance designations. Potential geologic resources in the affected environment, including highly erosion-sensitive soils, would not be impacted by construction, operation and maintenance, and decommissioning of a solar project north of I-10. The baseline conditions associated with geologic and soil resources north of I-10 would continue under Alternative 5.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but not within the City limits of Blythe in comparison to the proposed Project. Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The construction, operation, maintenance, and decommissioning of Alternative 5 would not exceed the impacts to geology and soils identified under the Alternative 1 analysis. Therefore, the Alternative 1 analysis would be applicable to Alternative 5, outside of those differences identified in the discussion below.

Analysis of Direct and Indirect Impacts

Construction

The construction of Alternative 5 would be similar to that of Alternative 1, with the exclusion of solar development north of I-10. Due to a reduced solar facility footprint under Alternative 5, the projected construction water requirements ([non-potable] used for dust suppression, concrete manufacturing, and fire safety) would be reduced below those estimated under Alternative 1.

Seismic Hazards

Seismic hazards related to Alternative 5 development would be similar to those under Alternative 1. The analysis under Alternative 1 would apply. The solar facility, as with the entire Southern California region, is subject to secondary effects from earthquakes. The closest active fault to the solar facility is the Brawley Seismic Zone. Severe ground shaking along the faults could result in damage to site structures, including the PV solar panels, inverters/transformers, interior collection power lines, the two on-site substations, and one O&M building, as well as the 7.8-mile gen-tie line. Implementation of Alternative 5 would not change the intensity of ground shaking that would occur on the solar facility during a seismic event.

Liquefaction

The RCGP indicates the Alternative 1 site is mapped within a zone described as “moderately susceptible” to liquefaction for areas with deep groundwater. As the Alternative 5 development footprint would fall within this area, the analysis for Alternative 1 would apply.

Landslides/Slope Stability

Preliminary Project plans indicate that the Alternative 1 Project boundary would be adjacent to the descending bluff along the eastern site boundary. A review of the RCGP Figure S-5 indicates that this slope has a low to locally moderate susceptibility to seismically induced landslides and rockfalls. However, Alternative 1 improvements are not anticipated to be constructed on or near the bluff slope. Because the Alternative 1 solar facility would be on relatively flat terrain and not subject to landslides, and Alternative 1 Project components would not be on or near the bluff slope, the potential for seismically induced landslides and debris flows at the site is considered low. As Alternative 5 would eliminate

development north of I-10, which also represents the eastern limits of Alternative 1, the potential for seismically induced landslides and debris flows at the site is considered even lower.

Soil Erosion

According to the geotechnical report prepared for the Project area, surface soils on the solar facility are generally comprised of sands and gravels. Based on the gentle gradients across the site, the potential for water erosion is low. However, portions of the site situated along the eastern boundary may be subject to water erosion down the bluff face. With implementation of Alternative 5, the area north of I-10, which also represents the eastern boundary, would not be developed. The remaining developed area of Alternative 5 would be similar to that of Alternative 1; as such, the Alternative 1 analysis would apply.

Subsidence/Lateral Spreading

RCGP Figure S-7 designates the Alternative 1 Project area as a "Susceptible Area." As the Alternative 5 development footprint is in the Alternative 1 Project area, the analysis under Alternative 1 would apply.

Expansive Soil

Based on a review of regional geologic maps and geologic reconnaissance, the deposits underlying the Alternative 1 solar generation site and gen-tie ROW consist of granular alluvial deposits (sands and gravels) with a low clay component which is generally not susceptible to expansion. This would also apply to Alternative 5, as the Alternative 5 footprint falls within the same areas as Alternative 1, with the exception of solar facility development north of I-10. Therefore, the same analysis for Alternative 1 would be applicable to Alternative 5.

Septic Tanks/Alternative Waste Water Disposal Systems

Alternative 5 would require the use of a septic tank system on the solar facility to treat domestic wastewater from one O&M building proposed to be adjacent to the solar facility. Alternative 5 would require a septic system permit from the Riverside County Department of Environmental Health Services prior to the installation of the septic system on the solar facility site.

Mineral Resources

Alternative 5 would make land unavailable for mineral extraction during the life of the Project on the solar facility site south of I-10. This would represent a minor potential for an adverse impact on mineral resources for several reasons:

1) Deposits of similar age and lithology that are likewise potential sources of sand and gravel are estimated to underlie a large portion of eastern Riverside County.
2) There is no information to indicate that the sand and gravel underlying the site is unique, of higher quality, or any more marketable than other similar deposits that are widespread throughout eastern Riverside County.
3) There is an existing producer of sand and gravel close to the Blythe Landfill, which likely would be able to serve local future demand for sand and gravel.
4) Following the decommissioning of Alternative 5, the land previously occupied by Alternative 5 would again be as available for exploration or production of aggregate construction materials as it is currently.

Alternative 5 and the associated gen-tie line would not block or otherwise impair access to a major public roadway. The presence of Alternative 5 would not prevent permitted prospectors or owners of mineral leases in the surrounding region from accessing areas outside the footprint of Alternative 5, such as the McCoy Mountains, because there are other routes available to access the surrounding mountains.

Seiche, Mudflow or Volcanic Hazard

There are no bodies of constant water in proximity to the Alternative 5 site, and the site is not near the shoreline or within 50 feet of sea level; therefore, hazards from a seiche or tsunami are considered to be negligible. Refer to the analysis for Alternative 1.

Operation and Maintenance

Similar to Alternative 1, and as stated above, the Alternative 5 solar facility would be in a seismically active region, and people and structures associated with Alternative 5 could be exposed to seismic ground shaking and subsequent seismic-related ground failure. The analysis for Alternative 1 would apply. Cleaning of the panels would require fewer AF/year under Alternative 5 as compared to Alternative 1. Cleaning operations would not alter the drainage patterns on-site, and would not lead to a substantial increase in erosion or loss of topsoil. Any surface water runoff resulting from permanent Alternative 5 features is not anticipated to influence surface runoff in a manner that would result in erosion or loss of topsoil.

The one O&M building under Alternative 5 would include a bathroom facility serviced by a private septic system and would be designated occupancy classification U. The septic system would be placed in soils capable of adequately supporting the septic system; therefore, operation of the septic system would not adversely affect soil resources.

Decommissioning

Because areas subject to decommissioning would have been disturbed during construction, no additional direct (at the time of decommissioning) or indirect (in the future after decommissioning is completed) effects to geologic and soil resources within the Alternative 5 area are anticipated during decommissioning of Alternative 5.

As stated above, the solar facility and gen-tie line would be in a seismically active region, and people and structures could be exposed to seismic ground shaking and subsequent seismic-related ground failure. These potentially significant impacts have been addressed above, and the regulatory requirements put in place prior to final design and construction would minimize any potential effects to geologic and soil resources during decommissioning activities.

Application of CEQA Significance Thresholds

GEO-1) Would Alternative 5 expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:

a) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault.
b) Strong Seismic ground shaking.
c) Seismic-related ground failure, including liquefaction.
d) Landslides.

The Alternative 5 solar facility would be in a seismically active region, and people and structures could be exposed to seismic ground shaking. Potentially significant impacts related to secondary seismic effects, including liquefaction and liquefaction-induced settlement, would be reduced to less than significant with implementation of Mitigation Measure Geology-1.

GEO-2) Would Alternative 5 result in substantial soil erosion or the loss of topsoil?

Implementation of Alternative 5 would result in both short-term, construction-related wind and water erosion and wind and water erosion related to Alternative 5 operation and maintenance

activities. These impacts would be reduced slightly in comparison to Alternative 1; however, the GEO-2 analysis under Alternative 1 would apply.

GEO-3) Would Alternative 5 be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

The GEO-3 analysis under Alternative 1 would apply to Alternative 5, as the underlying alluvium is expected to consist of loose to dense layers of silty sands and gravel, and some settlement of the loose soils underlying the surface is possible.

GEO-4) Would Alternative 5 be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life and property?

The potential for expansive soils to be encountered on the solar facility site and in the vicinity of the gen-tie line is considered low for Alternative 1. As the Alternative 5 development footprint falls within this same area, the GEO-4 analysis for Alternative 1 would apply.

GEO-5) Would Alternative 5 have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Alternative 5 would require the use of a septic tank system on the solar facility site to treat domestic wastewater from the one O&M building under this Alternative. Preliminary soils percolation testing (POWER Engineers: 123128 Percolation Test Report dated October 5, 2012) showed soils ranging from poorly graded, fine to medium grained, loose to medium dense sand with a trace of silt indicating that the proposal for an on-site wastewater treatment system or advanced treatment unit is feasible. Construction-related impacts from the septic system would be considered less than significant with implementation of Mitigation Measure Geology-2. No operation or decommissioning impacts are anticipated.

GEO-6) Would Alternative 5 be subject to geologic hazards, such as seiche, mudflow, or volcanic hazard?

There are no bodies of constant water in proximity to the Alternative 1 site, and the site is not near the shoreline or within 50 feet of sea level. Alternative 5 falls within this same location. Therefore, the GEO-6 analysis for Alternative 1 would apply.

GEO-7) Would Alternative 5 change topography or ground surface relief features?

The Alternative 5 boundary would not be adjacent to the descending bluff along the eastern site boundary as with Alternative 1. The remaining portion of the Alternative 5 site south of I-10 would be identical to Alternative 1. As such, the GEO-7 analysis for Alternative 1 would apply in this area.

GEO-8) Would Alternative 5 create cut or fill slopes greater than 2:1 or higher than 10 feet?

See GEO-7 above.

GEO-9) Would Alternative 5 result in grading that affects or negates subsurface sewage disposal systems?

Similar to Alternative 1, implementation of Alternative 5 would require the removal of three residences within the proposed development site that may have septic systems to treat domestic wastewater. These septic systems would be removed prior to Alternative 5 construction. In addition, Alternative 5 would not require extensive grading. Impacts would be less than significant.

GEO-10) Would Alternative 5 change deposition, siltation, or erosion that may modify the channel of a river or stream or the bed of a lake?

Refer to the Alternative 1 analysis for GEO-10.

GEO-11) Would Alternative 5 result in any increase in water erosion either on- or off-site?

See GEO-6 above.

GEO-12) Would Alternative 5 be impacted by or result in an increase in wind erosion and blowsand, either on- or off-site?

See GEO-11 above.

MR-1) Would Alternative 5 result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Based on the RCGP Figure OS-5, Mineral Resource Area, Alternative 1 would be within the State of California-designated MRZ Classification of MRZ-4, which is defined as an area where there is not enough information available to determine the presence or absence of mineral deposits. Alternative 5 would fall within this same location; therefore, the MR-1 analysis for Alternative 1 would apply.

MR-2) Would Alternative 5 result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Similar to Alternative 1, the Alternative 5 site is not delineated in the PVVAP or RCGP as a locally important mineral resource recovery site; therefore, the loss of availability of a delineated locally important mineral resource recovery site would not occur. There would be no impact.

MR-3) Would Alternative 5 be an incompatible land use located adjacent to a State classified or designated area or existing surface mine?

Because there are other major roadways within the Alternative 5 area, Alternative 5 would not prevent permitted prospectors or owners of mineral leases in the surrounding region from accessing areas outside the footprint of the Project, such as the McCoy Mountains. Therefore, Alternative 5 would not be an incompatible land use with a State-classified or designated area for mining operations. No impact would occur.

MR-4) Would Alternative 5 expose people or property to hazards from proposed, existing or abandoned quarries or mines?

Similar to Alternative 1, the Alternative 5 site is not used for mineral production, nor is it under claim, lease, or permit for the production of locatable, leasable, or salable minerals or mineral materials. Alternative 5 would not expose people or property to hazards from proposed, existing, or abandoned quarries or mines. No impact would occur.

Cumulative Impacts

Geographic Scope

Potential cumulative impacts to geology and soil resources would be limited to soil erosion and soil subsidence because many of the cumulative projects which would require soil disturbances in areas with loosely placed deposits, and collectively are cumulatively considerable. These potential cumulative impacts would apply mostly to construction and decommissioning phases of the Project. Other potential geology and soils issues (such as strong seismic ground shaking, liquefaction potential, collapsible soils, and expansive soils) relate to local and site-specific soil conditions, the severity of which is not connected with activities at the Project area. Such issues are site-specific and unaffected by the presence of other projects in the cumulative scenario.

The geographic scope of cumulative effects for mineral resources could include all areas within the cumulative projects area shown on Table 4.1-1. However, the proposed solar array site and private land portion of the gen-tie line are not in a designated mineral resource zone, and mineral extraction from the ROW portion on federal lands is not likely due to use of the area Solar Energy Zone. Consequently, the cumulative impacts relative to mineral resources are not cumulatively considerable and will not be discussed further.

Temporal Scope

The temporal scope of impacts associated with the proposed Project includes both short and long-term impacts to geology, soils, and seismicity during the construction and operation and maintenance periods. Short-term impacts related to construction are related to ground-disturbing activities such as grading and excavation to install or remove foundations. Long-term impacts associated with the Project include potential damage to proposed facilities due to seismic hazards that could occur over the operational life of the Project.

Analysis of Direct and Indirect Impacts

Alternative 1: Proposed Project

Construction, Operation, Maintenance, and Decommissioning

Environmental impacts related to geology and soils are generally site-specific. While geotechnical impacts may be associated with other developments in the Project area, by the very nature of the impacts (e.g., unstable soil units, expansive soils, seismic hazards), the constraints are site-specific and need to be addressed on a project-specific basis (impacts GEO-1 through GEO-12 and MR-1 through MR-4). Liquefaction and unstable soil hazards are very site-specific and are not cumulatively additive, but rather depend on local conditions as well as the characteristics of the overlying improvements.

The proposed Project, as well as other development projects, would be required to comply with the applicable State and local requirements including, but not limited to, the CBC, the County of Riverside County Code, and the City of Blythe Municipal Code (impact GEO-4). As such, Project-specific impacts, as well as the potential impacts associated with other projects, would be reduced to a less than significant level. Seismic impacts are a regional issue and are also addressed through compliance with applicable codes and design standards. The nature of these projects do not represent cumulatively significant impacts to geologic and soil resources following a seismic event, as the effects would be site-specific based on site-specific underlying conditions and proximity to the source of the seismic event. Therefore, the Project's contribution to cumulative geotechnical and soils impacts would be less than considerable (impact GEO-1).

In addition, implementation of site-specific SWPPPs (BMP-2) would minimize erosion potential from the Project areas (impact GEO-2). Impacts from erosion or loss of topsoil for other cumulative projects may require site-specific analysis to determine the underlying permeability, slope angle and length, extent of groundcover, and human influence on the sites; however, all projects in the cumulative setting would be required to adhere to similar erosion control requirements of a Drainage, Erosion, and Sedimentation Control Plan (BMP-1), as would the proposed Project. All construction phases of this Project, and other foreseeable projects in the area, would be required to adhere to all federal, State, and local programs, requirements, and policies pertaining to building safety and construction permitting. Accordingly, no significant cumulative impact would result from the cumulative scenario to which the Project's incremental impact could contribute.

Decommissioning activities are anticipated to be similar construction-related impacts, and would be required to comply with all local, State, and federal laws, regulations, and standards applicable at the time of decommissioning. Accordingly, no significant cumulative impact would result from the cumulative scenario to which the Project's incremental impacts resulting from decommissioning could contribute.

Alternative 2: No Project Alternative

Under the No Project Alternative, gen-tie facilities would not be constructed on BLM-managed lands and solar facilities would not be constructed on private lands. The public lands in the Project area would continue to be managed by BLM in accordance with existing land use designations in the CDCA Plan, whereas the private lands would continue to be managed for agricultural production. Alternative 2 would not contribute cumulative geology and soils impacts.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 is similar to Alternative 1 (proposed Project), with the exception of the location of the Northern 230 kV gen-tie line, which would be approximately 700 feet north of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1. As previously described under the cumulative analysis for Alternative 1, environmental impacts related to geology and soils are generally site-specific. While geotechnical impacts may be associated with other developments in the Project area, by the very nature of the impacts (e.g., unstable soil units, expansive soils, seismic hazards), the constraints are site-specific and need to be addressed on a project-specific basis (impacts GEO-1 through GEO-12 and MR-1 through MR-4). Liquefaction and unstable soil hazards are very site-specific and are not cumulatively additive, but rather depend on local conditions as well as the characteristics of the overlying improvements.

This Alternative, along with other development projects, would be required to comply with the applicable State and local requirements including, but not limited to, the CBC, the County of Riverside County Code, and the City of Blythe Municipal Code (impact GEO-4). As such, specific impacts with the development of Alternative 3, as well as the potential impacts associated with other projects, would be reduced to a less than significant level. Seismic impacts are a regional issue and are also addressed through compliance with applicable codes and design standards. The nature of these projects do not represent cumulatively significant impacts to geologic and soil resources following a seismic event, as the effects would be site-specific based on site-specific underlying conditions and proximity to the source of the seismic event. Therefore, Alternative 3's contribution to cumulative geotechnical and soils impacts would be less than considerable (impact GEO-1).

As also with Alternative 1, implementation of site-specific SWPPPs (BMP-2) would minimize erosion potential from the Project areas (impact GEO-2). Impacts from erosion or loss of topsoil for other cumulative projects may require site-specific analysis to determine the soils' permeability, slope angle and length, extent of groundcover, and human influence on the sites; however, all projects in the cumulative setting would be required to adhere to similar erosion control requirements of a Drainage, Erosion, and Sedimentation Control Plan (BMP-1), as would Alternative 3. All construction phases of this Project, and other foreseeable projects in the area, would be required to adhere to all federal, State, and local programs, requirements, and policies pertaining to building safety and construction permitting. Accordingly, no significant cumulative impact would result from the cumulative scenario to which this Alternative's incremental impact could contribute.

Decommissioning activities are anticipated to have similar construction-related impacts as described under Alternative 1.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Alternative 4 is similar to Alternative 1 (proposed Project), with the exception of the location of the Southern 230 kV gen-tie line, which would be approximately 0.8 mile south of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1. As previously described under the cumulative analysis for Alternative 1, environmental impacts related to geology and soils are generally site-specific. While geotechnical impacts may be associated with other developments in the Project area, by the very nature of the impacts (e.g., unstable soil units, expansive soils, seismic hazards), the constraints are site-specific and need to be addressed on a project-specific basis (impacts

GEO-1 through GEO-12 and MR-1 through MR-4). Liquefaction and unstable soil hazards are very site-specific and are not cumulatively additive, but rather depend on local conditions as well as the characteristics of the overlying improvements.

This Alternative, along with other development projects, would be required to comply with the applicable State and local requirements including, but not limited to, the CBC, the County of Riverside County Code, and the City of Blythe Municipal Code (impact GEO-4). As such, specific impacts with the development of Alternative 4, as well as the potential impacts associated with other projects, would be reduced to a less than significant level. Seismic impacts are a regional issue and are also addressed through compliance with applicable codes and design standards. The nature of these projects do not represent cumulatively significant impacts to geologic and soil resources following a seismic event, as the effects would be site-specific based on site-specific underlying conditions and proximity to the source of the seismic event. Therefore, Alternative 4's contribution to cumulative geotechnical and soils impacts is less than considerable (impact GEO-1).

As also with Alternative 1, implementation of site-specific SWPPPs (BMP-2) would minimize erosion potential from the Project areas (impact GEO-2). Impacts from erosion of loss or topsoil for other cumulative projects may require site-specific analysis to determine the soils' permeability, slope angle and length, extent of groundcover, and human influence on the sites; however, all projects in the cumulative setting would be required to adhere to similar erosion control requirements of a Drainage, Erosion, and Sedimentation Control Plan (BMP-1), as would Alternative 4. All construction phases of this Project, and other foreseeable projects in the area, would be required to adhere to all federal, State, and local programs, requirements, and policies pertaining to building safety and construction permitting. Accordingly, no significant cumulative impact would result from the cumulative scenario to which this Alternative's incremental impact could contribute.

Decommissioning activities are anticipated to be similar construction-related impacts as described under Alternative 1.

Alternative 5: Reduced Acreage Alternative

Construction, Operation, Maintenance, and Decommissioning

Alternative 5, as well as other development projects, would be required to comply with the applicable State and local requirements including, but not limited to, the CBC and the County of Riverside County Code; as such, the cumulative discussion under Alternative 1 would apply.

Mitigation Measures

The following mitigation measures would minimize and avoid impacts to geological and soil resources. No mitigation measures were proposed for mineral resources.

Geology-1 Prior to final design and construction, a site-specific subsurface geotechnical evaluation/report shall be prepared to evaluate the potential ground-shaking hazard, which would meet the requirements of the most recent version of the California Building Code. A state certified Project geologist shall ensure appropriate structural design and mitigation techniques achieve adequate protection according to industry standards and building code requirements.

Geology-2 Should future data suggest the presence of active faulting at the Project area, a fault evaluation may be performed. Mitigation of potential fault rupture hazard would typically include locating improvements away from the trace of an active fault, designing structures for an acceptable amount of movement, or implementing systems to maintain safety and that allow for displacement that could be repaired.

Geology-3 Removal of loose soil layers shall be replaced with compacted fill or specialized foundation design, including the use of deep foundation systems, to support structures. The septic system shall be placed in soils capable of adequately supporting the septic system as determined by the Project Geologist and in accordance with County requirements specified in the Department of Environmental Health Technical Guidance Manual.

Geology-4 Additional hydro-consolidation tests should be performed to verify soil stability during the design stages of the Project. Mitigation recommendations for hydro-consolidation may include removal of the collapsible soil layers and replacement with compacted fill or specialized foundation design including the use of deep foundations systems to support structures.

Residual Impacts After Mitigation

Implementation of mitigation measures Geology-1 and Geology-4 would reduce impacts to less than significant under CEQA and not substantial under NEPA.

NEPA Conclusions

The Project and each of the action Alternatives would have the impacts and contribution to cumulative impacts described above. These would not be significant with implementation of the mitigation measures described above. The Project would comply with all federal laws and criteria relating to geology and soils. The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged.

4.2.7 Greenhouse Gas Emissions

This section describes the impact analysis relating to greenhouse gas (GHG) emissions for the proposed Project and Alternatives. Information in this section was derived from the Project *Air Quality and Global Climate Change Technical Report* prepared by SRA, 2012 (included in this Draft EIR/EA as Appendix B).

The Climate Scenarios Report (CCC 2006) uses a range of emissions scenarios developed by the Intergovernmental Panel on Climate Change (IPCC) to project a series of potential warming ranges (i.e., temperature increases) that may occur in California during the twenty-first century. Three warming ranges were identified: lower warming range (3.0 to 5.5 degrees Fahrenheit [ºF]); medium warming range (5.5 to 8.0 ºF); and higher warming range (8.0 to 10.5 ºF). The Climate Scenarios Report then presents an analysis of the future projected climate changes in California under each warming range scenario.

According to the report, substantial temperature increases would result in a variety of impacts to the people, economy, and environment of California. These impacts would result from a projected increase in extreme conditions, with the severity of the impacts depending upon actual future emissions of GHGs and associated warming. If the Project were to contribute substantially to climate change, then it would be contributing to the following potential consequences of climate change.

Public Health. Higher temperatures are expected to increase the frequency, duration, and intensity of conditions conducive to air pollution formation. For example, days with weather conducive to ozone (O_3) formation are projected to increase by 25 to 35 percent under the lower warming range and 75 to 85 percent under the medium warming range. In addition, if global background O_3 levels increase as is predicted in some scenarios, it may become impossible to meet local air quality standards. An increase in wildfires could also occur, and the corresponding increase in the release of pollutants, including fine particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$), could further compromise air quality. The Climate Scenarios Report indicates that large wildfires could become up to 55 percent more frequent if GHG emissions are not significantly reduced.

Potential health effects from global climate change may arise from temperature increases, climate-sensitive diseases, extreme events, and air quality degradation. There may be direct temperature effects through increases in average temperature leading to more extreme heat waves and less extreme cold spells. Those living in warmer climates are likely to experience more stress- and heat-related problems (e.g., heat rash and heat stroke). In addition, climate-sensitive diseases (such as malaria, dengue fever, yellow fever, and encephalitis) may increase, such as those spread by mosquitoes and other disease-carrying insects.

Water Resources. A vast network of reservoirs and aqueducts captures and transports water throughout the state from northern California rivers and the Colorado River. The current distribution system relies on Sierra Nevada mountain snowpack to supply water during the dry spring and summer months. Rising temperatures, potentially compounded by decreases in precipitation, could severely reduce spring snowpack, increasing the risk of summer water shortages. In addition, if temperatures continue to rise, more precipitation would fall as rain instead of snow, further reducing the Sierra Nevada spring snowpack by as much as 70 to 90 percent. The state's water resources are also at risk from rising sea levels. An influx of seawater would degrade California's estuaries, wetlands, and groundwater aquifers.

Agriculture. Increased GHG and associated increases in temperature are expected to cause widespread changes to the agricultural industry, reducing the quantity and quality of agricultural products statewide. Significant reductions in available water supply to support agriculture would also impact production. Crop growth and development would change, as would the intensity and frequency of pests and diseases.

Ecosystems/Habitats. Continued global warming would likely shift the ranges of existing invasive plants and weeds, thus altering competition patterns with native plants. Range expansion is expected in many species, while range contractions are less likely in rapidly evolving species with significant populations already established. Continued global warming is also likely to increase the populations and types of pests. Continued global warming would also affect natural ecosystems and biological habitats throughout

the state. This effect of global climate change could affect current ecosystems/habitats in desert areas near the proposed solar facility.

Wildland Fires. Global warming is expected to increase the risk of wildfire and alter the distribution and character of natural vegetation. If temperatures rise into the medium warming range, the risk of large wildfires in California could increase by as much as 55 percent, which is almost twice the increase expected if temperatures stay in the lower warming range. However, since wildfire risk is determined by a combination of factors including precipitation, winds, temperature, and landscape and vegetation conditions, future risks would not be uniform throughout the State. Global climate change in the Southern California region could lead to increased risk of wildfires, which could reduce solar energy output by obscuring sunlight.

Rising Sea Levels. Rising sea levels, more intense coastal storms, and warmer water temperatures would increasingly threaten the State's coastal regions. Under the high warming scenario, sea level is anticipated to rise 22 to 35 inches by 2100. A sea level risk of this magnitude would inundate coastal areas with salt water, accelerate coastal erosion, threaten levees and inland water systems, and disrupt wetlands and natural habitats.

Methodology for Analysis

The effects of GHG emissions that would be generated from the proposed Project, as well as the consistency of the proposed Project with the applicable plans and programs that have been implemented by various federal, State, and local agencies with jurisdiction over the Project area, are addressed in this section. Potential GHG emissions from construction and operation, as well as potential emission reductions from fossil-fuel fired electricity generation displacement, are estimated quantitatively to evaluate the Project's contribution to cumulative GHG emissions.

CEQA Significance Criteria

The effects of project-specific greenhouse gas emissions are cumulative, and therefore global climate change impacts are addressed as a cumulative, rather than a direct, impact. The guidance for determining significance of impacts has been developed from the requirements of AB 32. The guideline addresses the potential cumulative impacts that a project's GHG emissions could have on global climate change. Based on Appendix G of the CEQA Guidelines and the County of Riverside CEQA Environmental Assessment Form, the following criteria indicate that a project could have potentially significant impacts to global climate change if it would:

GHG-1) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

GHG-2) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

As discussed in Section 15064.4 of the CEQA Regulations, the determination of the significance of GHG emissions requires a good-faith effort to assess the significance of impacts from GHG emissions, considering:

1) The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting.
2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

The California Air Pollution Controls Officers Association (CAPCOA) suggested several thresholds and approaches that could be used to determine the significance of greenhouse gas emissions (CAPCOA

2008). Of these, the threshold of 900 metric tons of CO_2-equivalent (CO_2e) was determined to be an appropriate threshold to determine a significant GHG impact because it is a very conservative threshold that is on the low end of CEQA significance thresholds that have been considered for implementation by other California air pollution responsible agencies, such as the Bay Area Air Quality Management District. The County of Riverside has not adopted this particular threshold for GHG emissions; however, the MDAQMD CEQA and Federal Conformity Guidelines (August 2011) includes the 100,000 tons per year (tpy) CO_2e and 548,000 pounds per day (lbs/day) CO_2e thresholds. As such, the significance criteria are used to provide a context for the magnitude of Project emissions in relation to its contribution to the cumulative impact of global climate change.

The CAPCOA approach directs that a GHG inventory be prepared for each project, and that GHG emissions associated with project implementation and operation be disclosed under "business as usual" conditions. "Business as usual" is defined as the emissions that would have occurred in the absence of reductions mandated under AB 32.

NEPA Requirements

On February 18, 2010, the CEQ issued draft guidance to federal agencies regarding GHG emissions. This guidance instructs agencies to take the following steps in an analysis of the direct effects of GHG emissions: quantify cumulative emissions over the life of the project; discuss measures to reduce emissions, including consideration of reasonable alternatives; and qualitatively discuss the link between such emissions and climate change. The CEQ further recommends that if a proposed action is reasonably anticipated to annually cause direct emissions of 25,000 metric tons or more of carbon dioxide equivalent (CO_2e) GHGs, agencies should consider conducting a quantitative and qualitative assessment. The guidance also states that "it is not currently useful for the NEPA analysis to attempt to link specific climatological changes, or the environmental impacts thereof, to the particular project or emissions, as such direct linkage is difficult to isolate and to understand."

Applicable Best Management Practices

No BMPs are proposed for GHG emissions.

Alternative 1: Proposed Project

Direct, Indirect and Cumulative Effects

Construction

The main source of GHG emissions associated with the Project would be combustion of fossil fuels during construction of the Project. Emissions of GHG were calculated using the same approach as emissions for overall construction emissions discussed in Section 4.2.3 and described in the *Air Quality and Global Climate Change Technical Report*, Appendix B. Construction of the solar arrays, substation, associated buildings, and gen-tie line, using "business as usual" conditions, would generate approximately 5,479 tons of CO_2e.

Emissions associated with construction would be temporary, occurring in one three-year period. Climate change, by contrast, occurs as a result of long-term changes in the earth's atmosphere. Accordingly, the total construction emissions were amortized over the life of the Project. Amortization of the construction emissions over the life of the Project would result in a contribution of about 183 metric tons of CO_2e per year.

It is noted that the existing baseline conditions on the site include GHG emissions associated with cultivation and harvest of field and orchard crops; however, the GHG emissions from these activities have not been estimated.

Operation and Maintenance

Emissions associated with operations are estimated to be 271 metric tons per year of CO_2e. It should be noted that the purpose of the Project is to provide electricity generation from a renewable resource. The Project would serve to meet the State's goals for the Renewable Portfolio Standard (RPS), which has been identified by the State as a means of meeting the goals of AB 32 to reduce emissions to 1990 levels by the year 2020. The Project's operational emissions would therefore be offset by the Project's provision of renewable energy that would replace conventionally generated electricity in the service area.

The Project is proposed to produce approximately 485 MW of electrical energy, which would be approximately 1,329,439,261 kilowatt hours (kWh) of electrical energy per year. In comparison, GHG emissions were estimated for a conventional fossil-fuel combustion power plant producing the same electrical energy (kWh) per year as the Project facility. Data from the U.S. Department of Energy, the EPA, and the Electric Power Research Institute provided GHG production rates per megawatt-hour (MWh). GHG emissions from the most efficient combined cycle gas turbine power plant and a coal-fired power plant were calculated based on 0.35 and 1.0 metric tons of CO_2e per MWh of electricity produced by gas turbine and coal-fired plants, respectively. Gas turbine and coal-fired plants are estimated to produce approximately 371,922 and 1,062,635 metric tons of CO_2e, respectively. The Project would result in a net GHG reduction (displacement) through the replacement of fossil-fuel generated electricity with solar electricity of from 371,116 to 1,061,829 metric tons of CO_2e per year. Operation of the Project would result in a substantial net displacement of GHG emissions in the region with the implementation of the Project's solar facility, when compared to a conventional fossil-fuel combustion power plant.

Decommissioning

Decommissioning of the proposed Project would require removal of the solar equipment and facilities (including gen-tie structures) and transporting all components off-site. Equipment used for decommissioning would generally be similar to that used for construction; however, it is anticipated that the overall activity necessary during decommissioning could be completed in one year and would be much less than that of construction. Conservatively, it is estimated that the annual GHG emissions for decommissioning would be about one half that of construction, resulting in emissions during the one-year decommissioning period of 913 metric tons of CO_2e.

Total GHG from All Phases

Adding the construction, operations, and decommissioning emissions, amortized over the life of the Project (considering three years of construction, 25 years of operation, and two years of decommissioning), the total GHG emissions from the Project are estimated to be approximately 484 metric tons of CO_2e annually, which is below the CAPCOA-based threshold of 900 metric tons per year of CO_2e and is also below the federal mandatory GHG emissions reporting threshold of 25,000 metric tons of CO_2e. Consequently, even if displacement of electricity use were not considered, the proposed Project's GHG emissions would not contribute substantially to global GHG emissions.

As explained above, the Project's operation would result in a net GHG reduction (displacement) through the replacement of fossil-fuel-generated electricity with solar electricity of from 371,116 to 1,061,829 metric tons of CO_2e per year. The Project's displacement of emissions from fossil-fuel-generated electricity offsets the total GHG emissions from all aspects of the Project, and results in a substantial Project benefit.

Application of CEQA Significance Thresholds

Construction, Operation, Maintenance, and Decommissioning

GHG-1) Would the Project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

The proposed Project would not generate GHG emissions, either directly or indirectly, such that they would have a significant impact on the environment. Overall, the total GHG emissions for all phases amortized over the life of the Project would not exceed CAPCOA thresholds and would be less than significant. In addition, the Project would result in a substantial benefit by offsetting GHG emission from fossil-fuel-generated electricity, and would assist in meeting the State's adopted RPS.

GHG-2) Would the Project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Since the proposed Project would result in a significant offset of regional air emissions associated with energy production from fossil fuels, a net reduction in GHG emissions could result. The Project would serve to meet the State's goals for the RPS, which has been identified by the State as a means of meeting the goals of AB 32 to reduce emissions to 1990 levels by the year 2020.

Alternative 2: No Project Alternative

The Project would not be constructed or require any operations or maintenance or decommissioning activities should Alternative 2, the No Project Alternative, be selected. As such, there would be no effects related to GHG emissions beyond those that already occur on the Project area as a result of existing agricultural operations. However, the beneficial impacts of the proposed Project associated with providing renewable energy in accordance with the State's adopted RPS would also not occur under this Alternative. That is, under the No Project Alternative, renewable energy would not be available to offset the use of energy from other sources, including fossil fuels. Consequently, the No Project Alternative would not achieve the GHG reduction associated with the proposed Project's operation, which was estimated to range from 371,116 to 1,061,829 metric tons of CO_2e per year.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Considering that Alternative 3 would require a slightly longer gen-tie line outside of the solar array site, the GHG emissions are estimated to be slightly greater than Alternative 1 during construction. Total GHG emissions would be minimally higher than Alternative 1, but would remain below the CAPCOA-recommended threshold of 900 metric tons per year of CO_2e; there would be no material difference in the level of significance of the impact. In addition, Alternative 3 would result in a substantial benefit by offsetting GHG emission from fossil-fuel-generated electricity, and would assist in meeting the State's adopted RPS.

Application of CEQA Significance Thresholds

Construction, Operation, Maintenance, and Decommissioning

GHG-1) Would Alternative 3 generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Alternative 3 would not generate GHG emissions, either directly or indirectly, such that they would have a significant impact on the environment. Overall, the total GHG emissions for all phases amortized over the life of Alternative 3 would not exceed CAPCOA thresholds and would be less than significant. In addition, Alternative 3 would result in a substantial benefit by offsetting GHG emission from fossil-fuel-generated electricity, and would assist in meeting the State's adopted RPS.

GHG-2) Would Alternative 3 conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Alternative 3 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG. No impacts would occur.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Alternative 4 would be very similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Considering that Alternative 4 would require a slightly longer total length of gen-tie line, the total GHG emissions are estimated to be slightly greater than Alternative 1 construction. Total GHG emissions would be minimally higher than Alternative 1, but would remain below the CAPCOA-recommended threshold of 900 metric tons per year of CO_2e; there would be no material difference in the level of significance of the impact. In addition, Alternative 4 would result in a substantial benefit by offsetting GHG emission from fossil-fuel-generated electricity, and would assist in meeting the State's adopted RPS.

Application of CEQA Significance Thresholds

Construction, Operation, Maintenance, and Decommissioning

GHG-1) Would Alternative 4 generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Alternative 4 would not generate GHG emissions, either directly or indirectly, such that they would have a significant impact on the environment. Overall, the total GHG emissions for all phases amortized over the life of Alternative 4 would not exceed CAPCOA thresholds and would be less than significant. In addition, Alternative 4 would result in a substantial benefit by offsetting GHG emission from fossil-fuel-generated electricity, and would assist in meeting the State's adopted RPS.

GHG-2) Would Alternative 3 conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Alternative 4 would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG. No impacts would occur.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Alternative 5 would include approximately 2,403 acres for the solar field. Similar to the proposed Project, 73 acres would be utilized for the 230 kV gen-tie line. In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building and would have one access point (planned on Seeley Avenue). The Reduced Acreage Alternative would also no longer extend a 230 kV overhead gen-tie line from an on-site substation north of I-10, as this Alternative would not be developed on land north of I-10. Instead, this Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility.

Under Alternative 5, a solar facility north of I-10 would not be constructed or require any operation, maintenance, or decommissioning activities. As such, there would be fewer GHG emissions from construction, maintenance, and decommissioning activities because the actual project development footprint would be smaller. However, the portion of the proposed Project's beneficial impacts of a solar development in the area north of I-10, associated with providing renewable energy in accordance with the State's adopted RPS, would also not occur under Alternative 5.

Direct, Indirect, and Cumulative Effects

Construction

As with Alternative 1, the main source of GHG emissions associated with Alternative 5 would be combustion of fossil fuels during construction. Alternative 5, because it proposes less construction, would emit fewer GHG than Alternative 1. When these emissions are amortized over the life of Alternative 5, these emissions would be less than significant and would not contribute considerably to a cumulative impact.

Operation and Maintenance

Operational emissions of Alternative 1 would not exceed the GHG significance threshold. Alternative 5 operations would result in reduced air emissions compared to Alternative 1, due to fewer full-time employees and a smaller footprint with less solar facilities. Accordingly, it too would not exceed the GHG significance threshold. Similar to Alternative 1, the purpose of Alternative 5 is to provide electricity generation from a renewable resource. The Reduced Acreage Alternative's operational emissions would therefore be offset by this Alternative's provision of renewable energy that would replace conventionally generated electricity in the service area. The extent of the benefit from replacing conventionally generated electricity with renewable energy would be less under Alternative 5 than under the proposed Project.

Decommissioning

Decommissioning of Alternative 5 would result in no greater GHG emissions than what was estimated under Alternative 1. As such, the annual GHG emissions for decommissioning would be approximately one half that of construction.

Total GHG from All Phases

Adding the construction, operation, maintenance, and decommissioning emissions, amortized over the life of the Project (considering three years of construction, 25 years of operation, and two years of decommissioning), the total GHG emissions from Alternative 5 would still remain below the CAPCOA-based threshold and also below the federal mandatory GHG emissions reporting threshold. Moreover, the long-term benefits of replacing conventionally generated electricity with renewable energy would reduce GHG emissions and is considered beneficial. Consequently, the Reduced Acreage Alternative's GHG emissions would not constitute a cumulatively considerable contribution to global climate change.

Application of CEQA Significance Thresholds

Construction, Operation, Maintenance, and Decommissioning

GHG-1) Would Alternative 5 generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Alternative 5 would not generate GHG emissions, either directly or indirectly, such that they would have a significant impact on the environment. The Reduced Acreage Alternative's construction and decommissioning GHG emissions would be temporary, and long-term operational GHG emissions would be less than significant. Moreover, the long-term benefits of replacing conventionally generated electricity with renewable energy would reduce GHG emissions and is considered beneficial. Overall, the total GHG emissions for all phases amortized over the life of Alternative 5 would be less than significant and would not constitute a cumulatively considerable contribution to global climate change.

GHG-2) Would Alternative 5 conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Since Alternative 5 would result in a significant offset of regional air emissions associated with energy production from fossil fuels, a net reduction in GHG emissions would result. Alternative 5 would serve to meet the State's goals for the RPS, which has been identified by the State as a means of meeting the goals of AB 32 to reduce emissions to 1990 levels by the year 2020.

Cumulative Impacts

The potential effects of proposed GHG emissions are by nature global and are cumulative in scope. As individual sources, GHG emissions are not large enough to have an appreciable effect on climate change. Therefore, the impact of proposed GHG emissions on climate change as discussed previously in this section is meant to address cumulative impacts of the proposed Project. As noted in the analysis, the proposed Project would contribute approximately 484 metric tons of CO_2e annually, which would not contribute considerably to a cumulative GHG impact, even if offsetting reductions in emissions from fossil-fuel-generated electricity were not considered. Alternatives 3 and 4 would generate slightly greater annual GHG emissions than Alternative 1 but would not contribute considerably to cumulative GHG impact. There would be fewer GHG emissions from construction, maintenance, and decommissioning activities for Alternative 5 because the actual project development footprint would be smaller. However, the portion of the proposed Project's beneficial impacts of a solar development in the area north of I-10, associated with providing renewable energy in accordance with the State's adopted RPS, would also not occur under Alternative 5. In addition, the proposed Project and Alternatives 3, 4, and 5 would result in a substantial benefit by offsetting GHG emissions from fossil-fuel-generated electricity, and would assist in meeting the State's adopted RPS.

The No Project Alternative would generate net zero GHG emissions, which would not contribute to a cumulative impact. However, the No Project Alternative also would not assist in meeting the State's adopted RPS.

Geographic Scope

By their nature, GHG emission impacts are cumulative, as GHG emission are aggregated across the global atmosphere and cumulatively contribute to climate change. Since GHG emission impacts are considered to be global effects, Earth's atmosphere is used as the geographic scope for analysis of GHG emissions impacts.

Temporal Scope

The temporal scope refers to the duration over which GHG impacts would occur. Given that GHG concentrations in Earth's atmosphere can lead to global climate change, which has the potential to impact numerous environmental resources through potential, though uncertain, impacts related to future air temperatures and precipitation patterns, there is currently no way to determine a definitive timeline wherein the full scale of consequences may occur from GHG impacts. Thus, it is not possible to determine the specific impact on global climate change from GHG emissions associated with the BMSP over the life of the Project.

Analysis of Direct and Indirect Impacts

Alternative 1 (Proposed Project), Alternative 3 (Northern 230 kV Gen-tie Line Location), and Alternative 4 (Southern 230 kV Gen-tie Line Location)

Construction, Operation, Maintenance, and Decommissioning

As discussed above, the proposed Project would contribute approximately 484 metric tons of CO_2e annually, which would not contribute considerably to a cumulative GHG impact even if offsetting reductions in emissions from fossil fuel generation of electricity were not considered. Alternatives 3 and 4

would generate slightly greater annual GHG emissions than Alternative 1 but would not contribute considerably to a cumulative GHG impact. In addition, as a renewable energy project, Alternatives 1, 3, and 4 would have a net benefit on climate change by reducing the State's reliance on non-renewable energy sources.

As described in the Solar PEIS, utility-scale solar energy development contributes relatively minor GHG emissions, generally from emissions from heavy equipment, primarily used during the construction phase; vehicular emissions; and natural gas or propane combustion of back-up generators (a factor not present in the proposed Project). The removal of plants from within a Project area can also reduce the amount of carbon intake from terrestrial vegetation, but only by a minimal amount. As discussed in the Solar PEIS, however, utility-scale solar energy production over the next 20 years will likely result in fewer CO_2 emissions from utilities by offsetting emissions from new fossil fuel energy sources. Overall, CO_2 emission offsets from increased solar energy production can range from a few percentage points to more than twenty percent in some study area states. According to the analysis in the Solar PEIS, "an estimated 716 kg (1,578 lb) of CO_2 would be displaced annually per megawatt-hour of solar energy produced" (DPEIS, § 5.11.1.2. Table 5.11-1, and § 5.11.4).

While in the near term, solar facilities such as development under Alternative scenarios 1, 3, 4, and 5 would tend to offset facilities serving peak loads rather than baseline loads served by large fossil-fuel plants, GHG emissions from future fossil fuel plants serving peak loads, typically natural gas-fired plants, would nevertheless be offset and CO_2 emissions on a per-average megawatt basis from non-renewable sources such as natural gas are exponentially higher than the incremental annual emissions from the proposed Alternatives. Further, the CARB has identified implementation of the Renewable Portfolio Standard as an integral part of AB 32. According to the AB 32 Scoping Plan, implementation of the RPS will contribute to a 21.3 million metric tons (MMT) of CO_2E reduction in GHG emissions by 2020 by reducing the State's reliance on fossil-fuel and natural gas-fired plants. The proposed Project is being designed and implemented in part to assist in achieving the RPS, and therefore the State's GHG reduction goals.

Since GHG emissions are aggregated across the global atmosphere and cumulatively contribute to climate change, it is not possible to determine the specific impact on global climate change from GHG emissions associated with the action Alternatives presented, or in conjunction with the identified cumulative projects. As noted in the analysis, however, the proposed Project would contribute approximately 484 metric tons of CO_2e annually, which would not contribute considerably to a cumulative GHG impact even if offsetting reductions in emissions from fossil fuel generation of electricity were not considered. Alternatives 3 and 4 would generate slightly greater annual GHG emissions than Alternative 1 but would not contribute considerably to a cumulative GHG impact. In addition, implementation of the proposed action Alternatives would likely lead to a net reduction in GHG emissions in the state overall, and thus a net benefit to global climate change, by displacing GHG emissions from non-renewable power sources. Implementation of the proposed action Alternatives would also assist the State in implementing the GHG reduction goals established in AB 32. In summary, it is likely that the proposed action Alternatives would have a net benefit on GHG emissions. The action Alternatives presented would not make a considerable contribution to global climate change, and therefore would not contribute significantly to cumulatively significant impacts related to global climate change when considered with other closely related past, present, and reasonably foreseeable future projects.

Alternative 2: No Project Alternative

The No Project Alternative would not contribute to any cumulative GHG effects. Unlike the action Alternatives, the No Project Alternative would not involve construction activities or operation of a solar generating facility; therefore, heavy equipment operation, truck deliveries, and construction worker commute trips would not be utilized, and increased GHG emissions would not occur as a result. However, the No Project Alternative would not assist in meeting AB 32 or Executive Order S-3-05 emission reduction targets, nor would it offset emissions generated by fossil-fuel-based sources of energy. Therefore, the No Project Alternative would have fewer impacts than the construction periods of the action Alternatives, but would result in greater impacts during the action Alternatives' operational periods.

Alternative 5: Reduced Acreage Alternative

Construction, Operation, Maintenance, and Decommissioning

Similar to the proposed Project, Alternative 5 would not contribute considerably to a cumulative GHG impact even if offsetting reductions in emissions from fossil fuel generation were not considered. In addition, as a renewable energy project, Alternatives 1, 3, 4, and 5 would have a net benefit on climate change by reducing the State's reliance on non-renewable energy sources.

In the near-term, solar facilities such as development under Alternative scenarios 1, 3, 4, and 5 would tend to offset facilities serving peak loads rather than baseline loads. In the long-term, such development would offset future fossil fuel plants serving peak loads, typically natural gas-fired plants. CO_2 emissions on a per-average megawatt basis from non-renewable sources such as natural gas are exponentially higher than the incremental annual emissions from the proposed Alternatives. Further, the CARB has identified implementation of the Renewable Portfolio Standard as an integral part of AB 32. According to the AB 32 Scoping Plan, implementation of the RPS will contribute to a 21.3 MMT of CO_2E reduction in GHG emissions by 2020 by reducing the State's reliance on fossil-fuel and natural gas-fired plants. The BMSP is being designed and implemented in part to assist in achieving the RPS, and therefore the State's GHG reduction goals.

Since GHG emissions are aggregated across the global atmosphere and cumulatively contribute to climate change, it is not possible to determine the specific impact on global climate change from GHG emissions associated with the action Alternatives presented, or in conjunction with the identified cumulative projects. Alternative 5 would contribute CO_2e annually, but would not contribute considerably to a cumulative GHG impact and its emissions would be more than offset by its replacement of fossil-fuel and natural gas-fired plants as noted above. Implementation of the proposed action Alternatives would likely lead to a net reduction in GHG emissions in the state overall, and thus a net benefit to global climate change, by displacing GHG emissions from non-renewable power sources. Implementation of the proposed action Alternatives would also assist the State in implementing the GHG reduction goals established in AB 32. In summary, it is likely that the proposed action Alternatives would have a net benefit on GHG emissions. The action Alternatives presented would not make a considerable contribution to global climate change, and therefore would not contribute significantly to cumulatively significant impacts related to global climate change when considered with other closely related past, present, and reasonably foreseeable future projects.

Mitigation Measures

Impacts would be less than significant for CEQA; no mitigation measures are recommended.

Residual Impacts After Mitigation

While the Project would generate some GHG emissions, the emissions are not projected to be substantial, and would not hinder compliance with any plans intended to avoid or reduce climate change. In addition, the Project would result in a substantial benefit by offsetting GHG emissions from fossil-fuel-generated electricity, and would assist in meeting the State's adopted RPS.

NEPA Conclusions

The Project and each of the action Alternatives would have the direct and indirect impacts and contribution towards cumulative impacts that are described above. The Project and the action Alternatives would conform to the policies and help achieve the goals of federal and State regulations and plans. The Project and each of the action Alternatives would help BLM implement the federal management objectives described in Chapter 1. The No Project Alternative would not have direct impacts, as the existing circumstances and operations would continue essentially unchanged. However, the No Project Alternative would not help achieve the goals of federal and State regulations and plans to reduce GHG emissions.

4.2.8 Hazards and Hazardous Materials

This section describes the impact analysis relating to hazards and hazardous materials for the proposed Project and Alternatives. It focuses on hazardous materials and hazards requiring remediation or mechanisms to prevent accidental release. Measures are identified to reduce or avoid adverse impacts anticipated from construction, operation, maintenance, and decommissioning of the proposed Project.

Various other hazards associated with the Project, such as exposure to electric and magnetic fields, interference with radio-frequency communications, hazardous shocks, fire hazards (non-wildland/operational), and valley fever are briefly discussed. These hazards are acknowledged as potential areas of concern, but there is no indication that the Project would cause a significant increase in these risks, as explained below.

This analysis does not address the potential exposure of workers to hazardous materials used at the proposed solar facility. Employers must inform employees of hazards associated with their work and provide those employees with special protective equipment and training to reduce the potential for health impacts from the handling of hazardous materials.

Methodology for Analysis

The hazardous materials analyzed include those potentially existing on the site and those that would be used as part of Project construction, operations and maintenance, and decommissioning. Potential existing hazards were assessed based on information contained in the *Phase I DataMap Area Study* prepared for the parcels comprising the Project area. This report is available in Appendix F of this Draft EIR/EA.

Some hazardous materials would be used on a short-term basis during construction and decommissioning. Others would be stored on-site for use during operations and maintenance. Therefore, this analysis was conducted by examining the choice and amount of chemicals to be used, the manner in which the Applicant would use the chemicals, the manner by which they would be transported to the facility, and the way in which the Applicant plans to store the materials on-site.

CEQA Significance Criteria

The criteria listed below were used to determine if the proposed Project would cause or exacerbate hazards on and in the vicinity of the solar facility. While CEQA and NEPA do not encompass a study of the environment on the Project, these criteria were also applied to determine whether the Project or any of its components would be exposed to substantial, existing risks. These criteria are the same as the significance criteria for Hazards and Hazardous Materials listed in the CEQA Environmental Checklist, Appendix G of the 2012 CEQA Guidelines. Under CEQA, the proposed Project and Alternatives would have a significant impact on hazards and hazardous materials if they would:

HAZ-1) *Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.*

HAZ-2) *Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.*

HAZ-3) *Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.*

HAZ-4) *Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment.*

HAZ-5) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would result in a safety hazard for people residing or working in the project area.

HAZ-6) For a project within the vicinity of a private airstrip, would result in a safety hazard for people residing or working in the project area.

HAZ-7) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

HAZ-8) Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

The following additional significance criteria from the County of Riverside CEQA Environmental Assessment Form are used in the analysis. A project could have potentially significant impacts if it would:

HAZ-9) Result in an inconsistency with an Airport Master Plan.

HAZ-10) Require review by the Airport Land Use Commission.

NEPA Requirements

The potential effects of the proposed Project and Alternatives are analyzed in relation to the baseline conditions (described in Chapter 3). The context and intensity of the environmental effects (40 CFR Part 1508.27) of the proposed Project and Alternatives with regard to creation of hazards and use of hazardous materials, as well as with regard to exposure to any existing or potential hazards or hazardous materials, are analyzed below and discussed as construction-related, operation and maintenance-related, and decommissioning effects.

Applicable Best Management Practices

As part of the Project and Alternatives, the following applicable BMPs would minimize the environmental impacts for hazards and hazardous materials. The full BMPs have been detailed below (see also Table 2-4 in Chapter 2) and are further referenced (by number) within the impact discussion.

NUMBER	BMP DESCRIPTION
BMP-3	**Fugitive Dust Abatement Plan.** As required by the Mojave Desert Air Quality Management District Rule 403, a Fugitive Dust Abatement Plan would be prepared to address fugitive dust emissions during Project construction, operation, maintenance, and decommissioning. The plan would include measures to minimize fugitive dust emissions from wrecking, excavation, grading, clearing of land, and solid waste disposal operations, and would take every reasonable precaution to prevent visible particulate matter from being deposited upon public roadways as a direct result of operations. During construction, all unpaved roads, disturbed areas (e.g., areas of scraping, excavation, backfilling, grading, and compacting), and loose materials generated during Project construction activities would be watered as frequently as necessary to minimize fugitive dust generation. However, the amount of water will be minimized each time to prevent temporarily ponding water that may occur as a result of the fugitive dust plan. In water-deprived locations, water spraying would be limited to active disturbance areas only, and non-water-based dust control measures would be implemented in areas with intermittent use or use that is not heavy, such as stockpiles or access roads. Alternatively, chemical dust suppressants or durable polymeric soil stabilizers could be used. The dust suppression measures would consider the sensitivity of wildlife to the windborne dispersal of fugitive dust containing dust suppressants and the potential impact on future reclamation.

NUMBER	BMP DESCRIPTION
BMP-9	**Hazardous materials.** As required by the Clean Air Act, Section 401 of the Clean Water Act, the Toxic Substance Control Act, and the Hazardous Materials Transportation Act, all vehicles and equipment must be in proper working condition to ensure that there is no potential for fugitive emissions or accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, or other hazardous materials. Equipment must be checked for leaks prior to operation and repaired as necessary. Refueling of equipment must take place on existing paved roads, where possible, and not within or adjacent to drainages. Hazardous spills must be cleaned up immediately. Contaminated soil would be disposed of at an approved off-site landfill, and spills reported to the permitting agencies. Service/maintenance vehicles should carry appropriate equipment and materials to isolate and remediate leaks or spills, and an on-site spill containment kit for fueling, maintenance, and construction will be available. Cleaning of construction vehicles at commercial car washes should be considered rather than washing vehicles on the Project area so that dirt, grease, and detergents are treated effectively at existing facilities designed to handle those types of wastes.
BMP-10	**Integrated Weed Management Plan.** In compliance with the Federal Noxious Weed Act and the Plant Protection Act, a Project-specific integrated weed management plan for the control of noxious weeds and invasive plant species would be prepared. The plan would identify presence, location, and abundance of weed species in the Project area and surrounding area adjacent to the Project, as well as identify suppression and containment measures to prevent the spread of weed species and introduction of weed species. Prevention techniques would include: limiting disturbance areas during construction to the minimum required to perform work; limiting ingress and egress to defined routes; maintaining vehicle wash and inspection stations; and closely monitoring the types of materials brought on-site to minimize the potential for weed introduction. During operations, noxious and invasive weed management will be incorporated as a part of mandatory site training for groundskeepers and maintenance personnel. Training will include weed identification and the impacts on agriculture, wildlife, and fire frequencies. Training will also cover the importance of preventing the spread of noxious weeds and of controlling the proliferation of existing weeds.

Alternative 1: Proposed Project

Analysis of Direct and Indirect Impacts

Construction

Pesticide Residue

Portions of the proposed Project area are in agricultural production. As a result, there is a potential for residual, low-level concentrations of pesticides and other agricultural chemicals to be present in soil and/or groundwater. Should there be chemically impacted soils (i.e., fuels, pesticides, herbicides) be present in the Project area, the risk of exposure to human health is not believed to be a significant concern (refer to Environmental Data Resources, Inc. [EDR] report in Appendix F of this Draft EIR/EA). The construction of the proposed Project would require minimal grading for the foundations of the substations and O&M buildings; therefore, it is anticipated that workers' exposure to impacted soils would be at low-level concentrations.

Asbestos-Containing Materials and Lead-Based Paint

The three properties (APNs 821-120-026, 821-120-039, and 863-100-106) within the solar facility site would be removed as part of the proposed Project. These properties were constructed prior to or during the 1970s; therefore, it is very likely that the building materials used for the on-site structures have asbestos-containing materials (ACM) or lead-based paint (LBP). Generally, asbestos removal operations are low risk. When following asbestos-related regulations, the possibility of exposure to airborne asbestos fibers from asbestos removal projects is limited. Buildings identified as containing building components coated with LBP would tested for LBP. All on-site construction workers that would be working with coated or glazed building components would be knowledgeable about LBP removal and abatement.

Hazardous Materials on Adjacent Properties

The Project area is situated on the very east end of the Palo Verde Mesa. Urban development near and adjacent to the Project area includes the community of Nicholls Warm Springs/Mesa Verde, Blythe Airport, the 520-MW natural gas-fired Blythe Generating Plant, an existing solar facility site (Blythe Solar Project, owned by NRG), electrical substations, electrical transmission lines, ancillary agricultural facilities, dirt roads, and commercial businesses. I-10 crosses through the study area in an east-west alignment. It is not anticipated, however, that there would be associated risks resulting from hazardous materials on adjacent properties due to the nature of these developments and their proximity to the Project facility.

Herbicide Use

During the construction period, herbicide may be applied to control weed growth. Use of herbicides would occur in accordance with all recommended application procedures as identified on product labels as well as in cooperation with the County Agricultural Commissioner and BLM. In addition, a project-specific Integrated Weed Management Plan (BMP-10) would be developed and approved by the County Agricultural Commissioner and BLM prior to any application of herbicides on the Project for weed management.

Hazardous Materials Use

A variety of hazardous materials listed below would be used during construction of the proposed Project and stored on-site:

- 20 – cans of miscellaneous paint stored in its original tin-coated steel quart or gallon containers
- 20 – 30 gallon diesel tank storage drum barrels
- 20 – 30 gallon gasoline tank storage drum barrels
- 100 – Silicone Sealants (12 ounce tubes)
- 100 – Foam Sealants (24 ounce tubes)
- 100 – Silicone Adhesives (12 ounce tubes)

No secondary containment method is included in these containers. Basic hazardous material spill kits will be stored in the temporary construction trailers located on the Project area during construction. The Project will coordinate with registered hazardous waste transporters if spills or release result in contaminated soils.

Transport

Some hazardous materials, which would be transported to the site, would be required during construction of the proposed Project. These include diesel fuel, oil, and grease for heavy equipment as well as paints and solvents. Large quantities of these materials are not anticipated to be transported. However, all hazardous materials transported to the site would be managed in compliance with applicable laws and regulations. Should a vehicle such as a gasoline tank be required, transport would occur in compliance with Department of Toxic Substances Control (DTSC) regulations.

Use and Storage

As described above, a variety of hazardous materials would be used during construction of the proposed Project. Typical materials associated with construction include gasoline, diesel fuel, oils, and lubricants for operation and maintenance of heavy equipment. Solvents, detergents, and degreasers are also used in association with heavy equipment. Other materials, such as paints, ethylene glycol, and welding materials, may all be used to varying extents as the Project is constructed. No acutely toxic hazardous materials would be used during construction. Further, none of the materials are anticipated to pose a

significant potential for off-site impacts as a result of the quantities used, their relative toxicity, physical states (e.g., liquid or gas), and/or environmental mobility (e.g., ability to travel through soil or water).

Disposal

Leftover or spent materials would be generated during construction of the Project. These materials could include empty containers, used oil filters, used batteries, used hydraulic fluid, oils, and grease. BMPs have been identified to prevent improper handling and disposal of materials by prohibiting hazardous materials from being drained onto the ground or into streams or drainage areas. Likewise, all construction waste, including petroleum products, and other potentially hazardous materials would be required to be removed to a disposal facility authorized to accept such materials. Hazardous wastes generated during construction (such as spent oil) or remaining from construction activities would be disposed of in an approved landfill (Blythe Landfill). All hazardous wastes shipped off-site for disposal would be transported by a licensed and permitted hazardous waste hauler. Any waste generated by the Project will be disposed of at the Blythe Landfill. It is estimated that the remaining disposal capacity of the Blythe Landfill will last until approximately 2047. Compliance with these BMPs and haul methods would be effective to ensure proper disposal of hazardous materials.

If any underground storage tanks are discovered during construction and require removal, the Project will comply with the Underground Storage Tank Guidelines to Closure by Removal procedures published by the Hazardous Materials Management Division of Riverside County Department of Environmental Health.

Hazardous Materials/Spill Release Response Procedures

The Project will have an Emergency Action Team on-site to lead hazardous material or spill release response procedures as outlined in the *Release Reporting Guidelines* published by the Riverside County Department of Environmental Health, Hazardous Materials Management Branch. The Emergency Action Team is made up of two to three construction personnel who include the Construction Manager (Team Leader), a Field Engineer, and a construction worker.

The Emergency Action Team will initiate emergency communication and full evacuation procedures when conditions warrant for the following major emergencies (including, but not limited too);

1) Large or rapidly spreading fires.
2) Combustible gas line/tank ruptures.
3) Other immediate releases of flammable, corrosive, or noxious, oxidizer/highly visible gases, vapor, smoke and dust or toxic gases.
4) Spills, leaks or releases of flammable, corrosive or toxic materials of a large enough quantity to present a hazard to site occupants, adjacent properties and personnel or the community at large.
5) Explosions, Detonations or Deflagrations.
6) Earthquakes.
7) Bomb threats.
8) Security, violence, civil disobedience incident/situations.
9) Severe weather conditions (heat, cold, lightning).

Other actions to take may include:

1) Fires: Close all doors or tight fitting enclosures leading to the fire area during evacuation.
2) Interior Flammable or Combustible/Explosive Gas Releases: Leave all doors and building entry doors open during evacuation.
3) Earthquakes: Move away from window areas. Take cover in a doorway if possible. Do not leave the building during the earthquake. Be aware of overhead hazards, power lines, cranes,
4) Hoists or scaffolding or other heavy materials that could fall.
5) Bomb threats: Consult "Bomb Threat Procedures" located in the "Emergency Action Plan" section.

For smaller spills or leaks, the Emergency Action Team will shut-off valves or otherwise attempt to stop leaks at the source only if it is safe to do so. Small spills or leaks that can be safely controlled will be immediately contained by members of the Emergency Action Team in accordance with instructions from the Team Leader.

One universal spill kit and one oil-only spill kit will be located on-site at the temporary construction trailer throughout the duration of the construction process. Tables 4.2.8-1 and 4.2.8-2 list the contents of each spill release kit.

Table 4.2.8-1 Universal Spill Kit (Absorbs 24.6 gallons)

QUANTITY	CONTENTS
100	Gray universal heavyweight SonicBonded pads 15" x 19"
6	Gray universal polypropylene socks 3" x 4'
4	Gray universal polypropylene pillows 8" x 18"
1	Nitrile gloves, pair
1	Safety goggles
1	DOT Emergency Response GuideBook
1	7" Epoxy putty stick
3	Yellow disposal bag (black text: "Caution Handle with Care")
3	8" Nylon zip tie
1	Wheeled Kaddie with interior shelves and easy-view compartments

Table 4.2.8-2 Oil-only Spill Kit (Absorbs 24.6 gallons)

QUANTITY	CONTENTS
100	White oil-only heavyweight SonicBonded pads 15" x 19"
6	White oil-only polypropylene socks 3" x 4'
4	White oil-only polypropylene pillows 8" x 18"
1	Nitrile gloves, pair
1	Safety goggles

Hazardous spill mitigation materials and equipment, as well as personal protective equipment, will be used as needed in an effort to prevent spills into waterways by protecting drainage inlets, gutters, etc., and for cleanup. Sand or other absorbent materials can also be useful for absorption and containment. Material Safety Data Sheets for the materials in use on-site will be located at the temporary construction trailer.

Airport Land Use Compatibility Plan

The proposed Project falls within the Blythe Municipal Airport Influence Area (AIA), which is covered by the Riverside County Airport Land Use Compatibility Plan (RCALUCP). The majority of the proposed Project components would be within Compatibility Zones C, D, and E; no structures are proposed in Zone B1 (see Figure 4.2.8-1). Construction of the proposed Project is expected to require about three years total to complete. During the peak 24-month period, the number of construction workers could at times reach 500 persons and would typically range between 300 and 500 workers at the site. Up to 400 workers could be involved with solar panel installation at one time, and up to 150 persons could be involved with substation and O&M facility construction at any one time.

It is estimated that the construction of solar panels would proceed in stages, with about six blocks (600 acres total) under construction at any one time. Up to 350 workers could be involved with assembling these blocks. Assuming that all 350 workers could be involved with assembling an individual 100-acre block, the average intensity would be about four workers per acre, which does not exceed any RCALUCP Zone average occupancy criteria. For peak intensity, it is reasonable to expect that up to 50 persons

could be involved with assembling panels on any acre of the Project area. This level of activity would not exceed any RCALUCP Zone peak occupancy criteria.

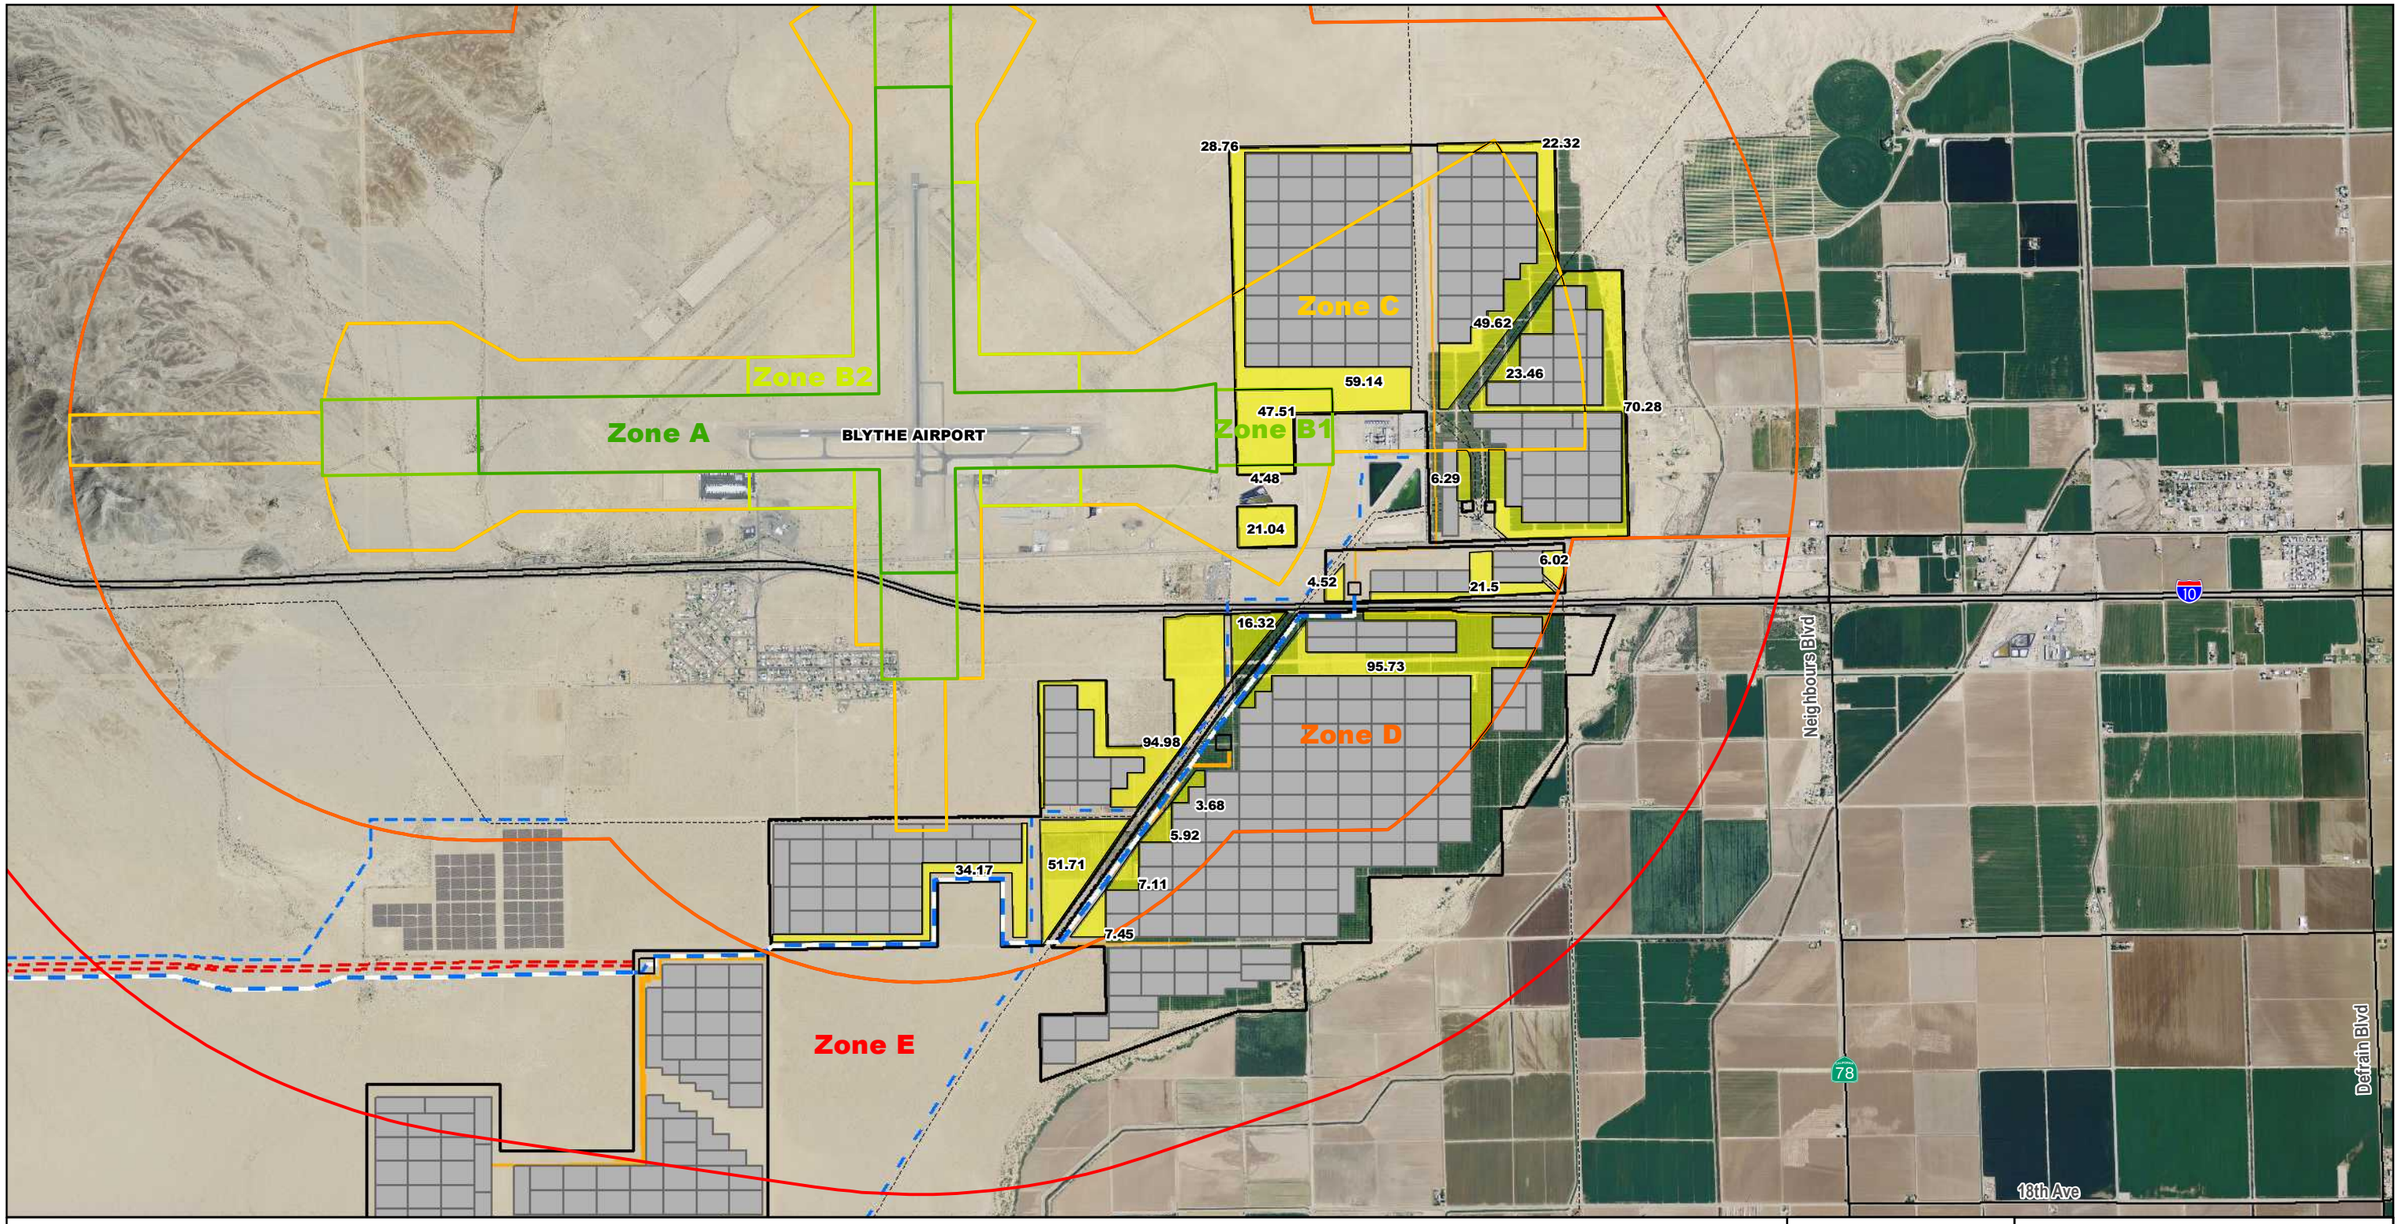
The O&M sites each measure about two acres in area; one would be in Zone D and the other in Zone E. The three substation sites are each about two acres in area; two would be in Zone D and one in Zone E. The peak construction work force for these facilities would be about 150 persons, or about 75 persons per acre. This level of activity would not exceed the peak or average intensity factor for Zone D.

Operation and Maintenance

Herbicides

A long-term strategy for weed control and management would be implemented during operation of the Project. An Integrated Weed Management Plan (BMP-10) would be prepared and approved by the County and BLM prior to ground-disturbing activities, and implemented during operation and maintenance of the gen-tie line. The Integrated Weed Management Plan would describe specific ongoing measures to remove weedy plant species from the ROW and encourage native plant growth. If herbicides are used, they would be applied in accordance with all recommended application procedures as identified on product labels as well as in cooperation with the County Agricultural Commissioner for application on County lands.

Transport, Use and Storage, and Disposal of Hazardous Materials



Small quantities of hazardous materials would be transported to the site (in accordance with DTSC regulations, as applicable) and used and stored on-site for miscellaneous, general maintenance activities. Hazardous materials are expected to include consumer-sized containers of oils, grease, paints, and solvents. Small quantities of diesel fuel and gasoline may also be stored at the facility for use in off-road service vehicles and generators. Dielectric insulating oil would be used in some electrical equipment, such as the on-site transformer(s). Oil-containing equipment would be installed with a spill containment system designed to contain all the oil in the event of a leak designed to contain all the oil in the event of a leak.

As part of the proposed Project, BMP-9 (Hazardous Materials) would be implemented, which would ensure that impacts would be minimized associated with hazardous materials storage and use during operation and maintenance by requiring that all fuels, fluids, and components with hazardous materials/wastes be handled in accordance with applicable regulations. Likewise, all such materials would be required to be kept in segregated storage with secondary containment. Compliance with applicable laws and the implementation of BMPs would be adequate to address storage and handling of hazardous materials for the solar facility. Vehicles and equipment would also be in proper working condition to ensure there is no potential for fugitive dust (BMP-3) and accidental release of motor oil, fuel, or other hazardous materials.

In addition to Riverside Waste Management, several agencies impose regulations regarding storage and management of hazardous materials. The Riverside County Fire Department, Riverside County Office of Emergency Services, the DTSC, and the Certified Unified Program Agency (CUPA) all regulate storage of hazardous materials. Compliance with the standards of these agencies must be followed. As with construction, any hazardous materials requiring disposal would be disposed of in an approved landfill.

Riverside County Airport Land Use Compatibility Plan

Table 4.2.8-3 lists the total acreage of the proposed solar facility site that would be within the Compatibility Zones, acreage of disturbance (areas with above-ground structures), open space (areas without above-ground structures that are a minimum size of 300 feet by 75 feet), percentage of the solar facility site that contains open space within each zone, and the RCALUCP's minimum open space requirements. As illustrated in the table below and Figure 4.2.8-1, the Project would meet the RCALUCP's minimum open space requirements.

Table 4.2.8-3 Blythe Municipal Airport Compatibility Zones Associated with the Solar Facility

ZONE	TOTAL ACRES WITHIN ZONE	ACRES OF DISTURBANCE	OPEN SPACE ACRES	% OF OPEN SPACE	MIN. RCALUCP REQUIREMENTS
Zone B1	47.5	0.0	47.5	**100.0%**	30%
Zone C	668.2	510.4	157.8	**23.6%**	20%
Zone D	1,676.6	1,199.8	476.8	**28.4%**	10%
Zone E	901.3	771.5	129.8	**14.4%**	not applicable

Source: Compiled by POWER 2012.

The electricity from the PV panels would be transferred along medium-voltage (34.5 kV) distribution lines that would consist of above-ground poles (35 to 60 feet tall), with an average tower-to-tower span of 200 feet, and cross through Compatibility Zones C, D, and E.

The 230 kV gen-tie line (poles approximately 85 to 125 feet in height) would cross through Compatibility Zones D and E and proceed generally from I-10 in a southwesterly direction. The line would continue in a westerly direction, where it would terminate at the Colorado River Substation outside the Blythe Municipal AIA. The structure heights for the 34.5 kV distribution lines and 230 kV gen-tie line would be below the maximum height requirements of the RCALUCP's Policy 1.5.3(a)(9). The proposed gen-tie line would be within or adjacent to an existing utility corridor and co-located with other existing and planned transmission lines of similar height (see Figure 4.2.8-1 and Table 3.3.8-1). In addition, FAA issued "No Hazard to Air Navigation" Determinations for the 230 kV gen-tie line structures.

The Riverside County Airport Land Use Commission (ALUC) was concerned about the height of the 230 kV gen-tie line poles' potential reflection and glare impacts, and cumulative impacts and potential impacts to operations at the Blythe Airport. However, as requested by the ALUC, several 230 kV structures within Compatibility Zone C were relocated approximately 2,500 feet farther from Runway 17-35. In addition, as described in Section 4.2.1, *Aesthetics, Visual Resources, and Reflection*, a Glare Study was performed for the Project to assess potential impacts from reflection and glare. The findings from the Glare Study, as well as simulated animations, were presented to the ALUC. In April 2012, the ALUC found the Project is consistent with the RCALUCP (refer to Appendix N of this Draft EIR/EA).

Decommissioning

During decommissioning, substantial quantities of solid wastes (concrete, metal) and industrial wastes (dielectric insulating oil, diesel fuel) could result from dismantling the proposed Project. Large quantities of broken concrete from gen-tie line structure and building foundations and rock or gravel from on-site roads or electrical substations would be generated in addition to metal from fencing, structures, wiring, and water storage tanks. Transformers, inverters, the substation, and the septic system would all require removal and disposal. Other concrete foundations, such as those for buildings and inverter pads, would be demolished and removed or used on-site for fill as needed.

Gravel from roads would be either used on-site for fill or removed. Commercially reasonable efforts would be made to recycle or reuse materials from the decommissioning. All other materials would be disposed of at a licensed facility.

As part of the Project, BMP-9 (Hazardous Materials) would be implemented to ensure minimization of impacts associated with hazardous materials storage and use during decommissioning, as would be applied during construction and operation and maintenance. Compliance with applicable laws, as well as standards enforced by the agencies, including the DTSC, would reduce potential impacts from the use of hazardous materials at the solar facility such that no direct (spill or accidental release) or indirect (residual contamination after decommissioning) impact would occur during decommissioning of the proposed

Project. After decommissioning activities, the use of hazardous materials associated with the proposed Project would no longer exist.

The construction workforce anticipated for decommissioning would require a similar workforce to construction, but decommissioning would be less intense and last for a shorter duration; therefore, it is anticipated that the proposed Project would not exceed the RCALUCP's maximum densities/intensities thresholds during decommissioning.

Several hazards of potential concern to the public with no corresponding criteria are briefly discussed below. These hazards are acknowledged and discussed to the extent that they would result from the proposed Project and Alternatives.

Electric and Magnetic Fields

Any electricity generation project poses a potential for impacts to public health with respect to electric and magnetic fields (EMF). Both electric and magnetic fields occur together whenever electricity flows. Electric voltage (electric field) and electric current (magnetic field) from the proposed gen-tie line and the electrical collection system that would serve the solar array would create the potential for EMF exposure. The available evidence as evaluated by the California Public Utilities Commission (CPUC) and other regulatory agencies has not established that such fields pose a significant health hazard to exposed humans. To date, there are no health-based federal regulations or industry codes specifying environmental limits on the strengths of fields from power lines. Likewise, the State has not adopted any specific limits or regulations on EMF levels related to electric power facilities.

The potential for the gen-tie line on BLM-managed land to impact human health is minimal because it would primarily be within Utility Corridor K of the CDCA Plan. No residential uses are allowed within this corridor. In addition to the gen-tie line, the Project would include an electrical collection system that would primarily be installed underground. Based on the undeveloped and unpopulated nature of the setting for the Project overall (gen-tie line and PV solar facility), long-term exposure to EMF related to the Project is not expected and no impact would occur.

Interference with Radio-Frequency Communications

Gen-tie line-related radio-frequency interference is one of the indirect effects of Project operation. Interference may be produced by the physical interactions of line electric fields. Such interference is due to the radio noise produced by the action of the electric fields on the surface of the energized conductor. The phenomena involved is known as "corona discharge," but is referred to as "spark gap electric discharge" when it occurs within gaps between the conductor and insulators or metal fittings. When generated, spark gap electric discharge manifests itself as perceivable interference with radio or television signal reception or with other forms of radio communication. The level of interference depends on such factors as line voltage, distance from the line to the receiving device, orientation of the antenna, signal level, line configuration, and weather conditions. As a result, maximum interference levels are not specified as design criteria for modern transmission lines. The level of any such interference usually depends on the magnitude of the electric fields involved and the distance from the line. The potential for such impacts is minimized by reducing the line electric fields and locating the line away from inhabited areas. The proposed gen-tie line is primarily proposed within CDCA Corridor K in an unpopulated portion of the county.

The proposed gen-tie line would be built and maintained in keeping with all applicable standards and regulations, including those prescribed by the CPUC and State of California Rules for Overhead Electric Line Construction, General Order No. 95 (GO-95). The potential for spark gap electric discharge interference is usually of concern for lines of 345 kV and above, not for 230 kV lines. Since the proposed gen-tie line would be in rural and uninhabited desert open space, no direct (at the time of construction) or indirect (during operation of the gen-tie line) impacts related to radio-frequency interference would occur.

Hazardous Shocks

Hazardous shocks are those that could result from direct or indirect contact between an individual and an energized line. No design-specific federal regulations have been established to prevent hazardous shocks from overhead power lines. Safety is ensured within the industry through compliance with the requirements specifying the minimum national safe operating clearances applicable in areas where the line might be accessible to the public. The proposed gen-tie line would be in rural and uninhabited desert open space, making it highly unlikely that the public would come in contact with the line. Moreover, the gen-tie line would primarily be in a designated utility corridor (Corridors J and K) within the CDCA. The Project would be designed, constructed, and operated to meet or exceed the requirements of GO-95. The Project would include a grounding system that would dissipate current created by lightning and ground faults). Additionally, the Project would comply with the applicable U.S. Department of Labor, Occupational Safety and Health Standards.

The solar energy facility inverters and transformers would be placed on concrete foundations. Inverters would be housed in brick enclosures, while transformers would be housed in metal cabinets designed to meet National Electric Manufacturers Association 3R IP44 standards for electrical enclosures. Additionally, all electrical equipment would be subject to the product safety standard requirements of the Underwriters Laboratory and Conformance European certifications, which include assurance that the equipment would be safe to touch by humans and wildlife, and would not pose electrical shock or fire hazards. Therefore, no direct (during construction) or indirect (during operations and maintenance) impacts associated with hazardous shocks are anticipated to occur.

Fire Hazard (Non-Wildland/Operational)

Standard fire prevention and suppression measures would be implemented for the proposed Project. O&M buildings would be designed with fire protection systems based on applicable Riverside County and City of Blythe requirements. Systems where pressurized firewater is used would have electric pumps. Portable fire extinguishers of appropriate sizes and types would be located throughout the facility site. Class C (electrical) rated fire extinguishers would be mounted at each inverter.

The PV modules are typically Class C fire-rated and the remainder of the equipment would be of nonflammable material (aluminum, steel, and glass). The solar facility would be maintained with a minimum of vegetation and other combustible materials. Up to nine 10,000-gallon firewater tanks would be distributed throughout the solar facility. Access roads would provide emergency access throughout the solar facility. The Applicant would design, construct, and operate the solar facility to meet or exceed the requirements of GO-95, as well as implement BMP-4 (Fire Management and Protection Plan) to minimize potential hazards and accidents. Compliance with GO-95 includes clearance-related aspects that would apply to the gen-tie line to ensure adequate emergency access in the event of a fire.

Based on compliance with applicable requirements and design features incorporated as part of the Project, no direct impacts relative to fire hazards are anticipated during operation of the proposed Project.

Valley Fever

Construction of the proposed Project would occur in an area favorable to the growth of Valley Fever, a fungus (*Coccidioides immitis*) that grows in soils in areas of low rainfall, high summer temperatures, and moderate winter temperatures. Project construction would disturb the soil and cause the fungal spores to become airborne, potentially putting construction personnel and wildlife at risk of contracting Valley Fever. Most Valley Fever cases are very mild, and more than half of infected people either have no symptoms or experience flu-like symptoms and never seek medical attention.

While the potential for a direct impact could occur during construction in association with exposure of workers to Valley Fever spores, a dust abatement plan as required by the MDAQMD would minimize the spread of fungal spores, thereby reducing potential for contracting Valley Fever during construction (refer

to BMP-2: Fugitive Dust). No direct or indirect impacts associated with exposure to Valley Fever would occur during operation and maintenance.

Application of CEQA Significance Thresholds

HAZ-1) Would the Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

The Project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. The hazardous materials used during the construction phase would be typical of most construction projects of this type. Hazardous materials would be stored, managed, and disposed of per requirements of the Riverside County Fire Department, Riverside County Office of Emergency Services, DTSC, and CUPA. In addition, BMPs listed above would be implemented to minimize or avoid impacts related to the routine transport, use, or disposal of hazardous materials. Three structures on APNs 821-120-026 (shop), 821-120-039 (shop), and 863-100-016 (residence) would be removed as part of the proposed Project. These properties were constructed prior to or during the 1970s; therefore, it is very likely that the building materials used for the on-site structures ACM or LBP. With implementation of Mitigation Measures Hazards-1 and Hazards-2, impacts regarding the transport, use, and handling of hazardous materials during construction and operation of the proposed Project would be reduced to less than significant levels. It is anticipated that impacts from decommissioning would be similar to construction; however, decommissioning would not impact ACM or LBP.

HAZ-2) Would the Project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

The Project would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Impacts would be less than significant.

HAZ-3) Would the Project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

The Project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. No impacts would occur.

HAZ-4) Would the Project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

One aboveground storage tank was located within the Project solar facility site. It would be removed in compliance with all rules, laws, and regulations. Therefore, the Project would result in a less than significant hazard to the public or the environment.

HAZ-5) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project result in a safety hazard for people residing or working in the project area?

The Project would be within an existing airport land use plan. With implementation of Mitigation Measures Noise-1 and Noise-2, the Project would result in less than significant impacts to the safety of people residing and working in the Project area. In addition, the Project was designed to minimize and avoid obstructions that would compromise safe operations at the Blythe Airport. Accordingly, impacts would be less than significant.

HAZ-6) For a project within the vicinity of a private airstrip, would the Project result in a safety hazard for people residing or working in the project area?

The Project would not be within the vicinity of a private airstrip; therefore, no impact would occur.

HAZ-7) Would the Project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

The Project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; therefore, no impact would occur.

HAZ-8) Would the Project expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

The Project would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires; therefore, no impact would occur.

HAZ-9) Would the Project result in an inconsistency with an Airport Master Plan?

The proposed Project would not conflict with the RCALUCP. As described above, the proposed Project would not exceed the RCALUCP Zone maximum densities/intensities per acre for the average and peak criteria, as well as minimum open space requirements during construction, operation, maintenance, and decommissioning. The gen-tie line poles and 34.5 kV distribution line poles would not exceed the RCALUCP development height for Zones B1, C, D, or E. The gen-tie lines would also be parallel to existing and planned transmission lines that would be similar in height. In April 2012, the ALUC found the Project to be consistent with the RCALUCP. In addition, the FAA issued "No Hazard to Air Navigation" Determinations for the 230 kV gen-tie line structures. Less than significant impact would occur and no mitigation recommended.

HAZ-10) Would the Project require review by the Airport Land Use Commission?

See HAZ-9 above.

Alternative 2: No Project Alternative

Alternative 2, the No Project Alternative, assumes that the proposed Project would not be constructed. Under this Alternative, no federal approval would be required and no BLM-managed land would be crossed. The continuation of existing land uses would be expected based on the current General Plan and land use ordinance designations, and existing agricultural operations would continue on the site. Under the No Project Alternative, existing on-site hazards in the form of oil staining, unauthorized solid waste piles, and 55-gallon storage drums would remain on the solar facility.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Alternative 3 would place the gen-tie line several hundred feet north of the proposed alignment, and would impact essentially the same resources as the proposed alignment, except that the Alternative route would be closer to the airport. Given these similarities, potential impacts resulting from Alternative 3 would be essentially the same as those of Alternative 1.

Application of CEQA Significance Thresholds

HAZ-1) Would Alternative 3 create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Alternative 3 would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. The hazardous materials used during the construction phase would be typical of most construction projects of this type. Hazardous materials would be stored, managed, and disposed of per requirements of the Riverside County Fire Department, Riverside County Office of Emergency Services, DTSC, and CUPA. In addition, BMPs listed above would be implemented to minimize or avoid impacts related to the routine transport, use, or disposal of hazardous materials. Three structures on APNs 821-120-026 (shop), 821-120-039 (shop), and 863-100-016 (residence) would be removed as part of the proposed Project. These properties were constructed prior to or during the 1970s; therefore, it is very likely that the building materials used for the on-site structures have ACM or LBP. With implementation of Mitigation Measures Hazards-1 and Hazards-2, impacts regarding the transport, use, and handling of hazardous materials during construction and operation of the proposed Project would be reduced to less than significant levels. It is anticipated that impacts from decommissioning would be similar to construction; however, decommissioning would not impact ACM or LBP.

HAZ-2) Would Alternative 3 create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Alternative 3 would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Impacts would be less than significant.

HAZ-3) Would Alternative 3 emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Alternative 3 would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. No impacts would occur.

HAZ-4) Would Alternative 3 be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

One aboveground storage tank was located within the Alternative 3 solar facility site. It would be removed in compliance with all rules, laws, and regulations. Therefore, Alternative 3 would result in a less than significant hazard to the public or the environment.

HAZ-5) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would Alternative 3 result in a safety hazard for people residing or working in the Alternative 3 area?

Alternative 3 would be within an existing airport land use plan. With implementation of Mitigation Measures Noise-1 and Noise-2, Alternative 3 would result in less than significant impacts to the safety of people residing and working in Alternative 3 area. In addition, Alternative 3 was designed to minimize and avoid obstructions that would compromise safe operations at the Blythe Airport.

HAZ-6) For a project within the vicinity of a private airstrip, would Alternative 3 result in a safety hazard for people residing or working in the Alternative 3 area?

Alternative 3 would not be within the vicinity of a private airstrip; therefore, no impact would occur.

HAZ-7) Would Alternative 3 impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Alternative 3 would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; therefore, no impact would occur.

HAZ-8) Would Alternative 3 expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Alternative 3 would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires; therefore, no impact would occur.

HAZ-9) Would Alternative 3 result in an inconsistency with an Airport Master Plan?

Alternative 3 would not conflict with the RCALUCP. Alternative 3 would require the same number of workers as the proposed Project; therefore, it would not exceed the RCALUCP Zone maximum densities/intensities per acre for the average and peak criteria, as well as minimum open space requirements during construction, operation, maintenance, and decommissioning. The gen-tie line poles and 34.5 kV distribution line poles would not exceed the RCALUCP development height for Zones B1, C, D, or E. The gen-tie line, which would be slightly closer to the Blythe Airport than the proposed Project, would also be parallel to existing and planned transmission lines that would be similar in height. The FAA issued "No Hazard to Air Navigation" Determinations for Alternative 3's gen-tie poles on June 15, 2012. No impact would occur and no mitigation recommended.

HAZ-10) Would Alternative 3 require review by the Airport Land Use Commission?

The solar facility component of Alternatives 1 and 3 are the same; therefore, the ALUC has reviewed this component of Alternative 3. However, within the Blythe AIA, seven poles have not been reviewed by the ALUC and would require review. Since the FAA issued "No Hazard to Air Navigation" Determinations for these poles, no impacts are anticipated from the review of the ALUC.

Alternative 4: Southern Alternative 230 KV Gen-tie Line Location

Alternative 4 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Alternative 4 would place the gen-tie line several hundred feet south of the proposed alignment, and would impact the essentially the same resources as the proposed alignment, though the Alternative route would be farther away from the airport. Given these similarities, potential impacts resulting from Alternative 4 would be the essentially the same as or slightly less than those of Alternative 1.

Application of CEQA Significance Thresholds

HAZ-1) Would Alternative 4 create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Alternative 4 would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. The hazardous materials used during the construction phase would be typical of most construction projects of this type. Hazardous materials would be stored, managed, and disposed of per requirements of the Riverside County Fire Department, Riverside County Office of Emergency Services, DTSC, and CUPA. In addition, BMPs listed above would be implemented to minimize or avoid impacts related to the routine transport, use or disposal of hazardous materials. Three structures on APNs 821-120-026 (shop), 821-120-039 (shop), and 863-100-016 (residence) would be removed as part of the proposed Project. These properties were constructed prior to or during the 1970s; therefore, it is very likely that the building materials used for the on-site structures have ACM or LBP. With implementation of Mitigation Measures Hazards-1 and

Hazards-2, impacts regarding the transport, use, and handling of hazardous materials during construction and operation of the proposed Project would be reduced to less than significant levels. It is anticipated that impacts from decommissioning would be similar to construction; however, decommissioning would not impact ACM or LBP.

HAZ-2) Would Alternative 4 create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Alternative 4 would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Impacts would be less than significant.

HAZ-3) Would Alternative 4 emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Alternative 4 would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. No impacts would occur.

HAZ-4) Would Alternative 4 be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

One aboveground storage tank was located within the Alternative 4 solar facility site. It would be removed in compliance with all rules, laws, and regulations. Therefore, Alternative 4 would result in a less than significant hazard to the public or the environment.

HAZ-5) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would Alternative 4 result in a safety hazard for people residing or working in the Alternative 4 area?

Alternative 4 would be within an existing airport land use plan. With implementation of Mitigation Measures Noise-1 and Noise-2, Alternative 4 would result in less than significant impacts to the safety of people residing and working in the Project area. In addition, Alternative 4 was designed to minimize and avoid obstructions that would compromise safe operations at the Blythe Airport.

HAZ-6) For a project within the vicinity of a private airstrip, would Alternative 4 result in a safety hazard for people residing or working in the Alternative 4 area?

Alternative 4 would not be within the vicinity of a private airstrip; therefore, no impact would occur.

HAZ-7) Would Alternative 4 impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Alternative 4 would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; therefore, no impact would occur.

HAZ-8) Would Alternative 4 expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Alternative 4 would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires; therefore, no impact would occur.

HAZ-9) Would Alternative 4 result in an inconsistency with an Airport Master Plan?

Alternative 4 would not conflict with the RCALUCP. Alternative 4 would require the same number of workers as the proposed Project; therefore, it would not exceed the RCALUCP Zone maximum densities/intensities per acre for the average and peak criteria, as well as minimum open space requirements during construction, operation, maintenance, and decommissioning. Alternative 4's gen-tie line poles would be farther away from the Blythe Airport than the proposed Project's (Alternative 1). Therefore, the gen-tie line poles would not exceed the RCALUCP development height for Zones B1, C, D, or E. The gen-tie line would also be parallel to existing and planned transmission lines that are similar in height. No impact would occur and no mitigation recommended.

HAZ-10) Would Alternative 4 require review by the Airport Land Use Commission?

The solar facility component of Alternatives 1, 3, and 4 are the same; therefore, the ALUC has reviewed this component of Alternative 4. The portion of the gen-tie line that would extend outside the solar facility site would not be within the Blythe AIA; therefore, no review would be required by the ALUC. No impact would occur.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Alternative 5 would include approximately 2,403 acres for the solar field. Similar to the proposed Project, 73 acres would be utilized for the 230 kV gen-tie line. In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building and would have one access point (planned on Seeley Avenue). The Reduced Acreage Alternative would also no longer extend a 230 kV overhead gen-tie line from an on-site substation north of I-10, as this Alternative would not be developed on land north of I-10. Instead, this Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility. Alternative 5 would avoid impacts that would result from the construction, operation, maintenance, and decommissioning of a solar development north of I-10; however, the land on which Alternative 1 is proposed would continue with existing uses. Current agricultural practices north of I-10 would continue, and the expected current use of pesticides, fertilizers, and fuels for farming equipment would remain unchanged.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but not within the City limits of Blythe in comparison to the proposed Project. Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The construction, operation, maintenance, and decommissioning of Alternative 5 would not exceed those hazards and hazardous materials impacts identified under the Alternative 1 analysis. Therefore, the Alternative 1 analysis would be applicable to Alternative 5, outside of those differences identified in the discussion below.

Analysis of Direct and Indirect Impacts

Construction

Pesticide Residue

Similar to the Alternative 1 site, portions of the Alternative 5 site are in agricultural production. As a result, there is a potential for residual, low-level concentrations of pesticides and other agricultural chemicals to

be present in soil and/or groundwater. Application of herbicides and pesticides used in accordance with manufacturer-prescribed and labeled instructions would result in the potential presence of low concentrations of agricultural chemicals on the solar facility site, which is not anticipated to be at hazardous levels. Should they be chemically impacted soils (i.e., fuels, pesticides, herbicides) be present in the Project area, the risk of exposure to human health is not believed to be a significant concern. Furthermore, Alternative 5 would not contain a residential or commercial component that would expose people to potential pesticides or herbicides.

Hazardous Materials on Adjacent Properties

Refer to the analysis under Alternative 1.

Herbicide Use

During the construction period, herbicide may be applied to control weed growth. Use of herbicides would occur in accordance with all recommended application procedures as identified on product labels as well as in cooperation with the County Agricultural Commissioner and BLM. In addition, a project-specific Integrated Weed Management Plan (BMP-10) would be developed and approved by the County Agricultural Commissioner and BLM prior to any application of herbicides on Alternative 5 for weed management.

Hazardous Materials Use

Transport

Some hazardous materials, which would be transported to the Alternative 5 site, would be required during construction. These include diesel fuel, oil, and grease for heavy equipment as well as paints and solvents. Large quantities of these materials are not anticipated to be transported. However, all hazardous materials transported to the site, under the reduced access point for Alternative 5, would be managed in compliance with applicable laws and regulations. Should a vehicle such as a gasoline tank be required, transport would occur in compliance with DTSC regulations.

Use and Storage

Similar to Alternative 1, a variety of hazardous materials would be used during construction of Alternative 5. The analysis under Alternative 1 would apply.

Disposal

Although reduced under Alternative 5, leftover or spent materials would be generated during construction, similar to Alternative 1. The analysis under Alternative 1 would apply.

Airport Land Use Compatibility Plan

Although reduced to only the area south of I-10, Alternative 5 would fall within the Blythe Municipal AIA, which is covered by the RCALUCP. Similar to Alternative 1, the majority of Alternative 5 components would be within Compatibility Zones C, D and E; no structures are proposed in Zone B1. Construction of the proposed Project is expected to require about three years total to complete. During the peak 24-month period, the number of construction workers could at times reach 400 persons and would typically range between 200 and 400 workers at the site. As these numbers would fall under estimations for Alternative 1 and Alternative 1 does not exceed any RCALUCP Zone average occupancy criteria, it is reasonable to expect that the Alternative 5 level of activity would not exceed any RCALUCP Zone peak occupancy criteria.

Under Alternative 5, one O&M site would be developed in Zone D and the other in Zone E. The three substation sites would each about two acres in area; two would be in Zone E. The peak construction work

force for this facility would be about 150 persons, or about 75 persons per acre. This level of activity would not exceed the peak or average intensity factor.

Operation and Maintenance

Herbicides

A long-term strategy for weed control and management would be implemented during operation of Alternative 5, similar to Alternative 1. Refer to analysis under Alternative 1.

Transport, Use and Storage, and Disposal of Hazardous Materials

As with Alternative 1, small quantities of hazardous materials would be transported to the site for Alternative 5 (in accordance with DTSC regulations, as applicable) and used and stored on-site for miscellaneous, general maintenance activities. Refer to analysis under Alternative 1.

Riverside County Airport Land Use Compatibility Plan

As development of Alternative 1 would meet the RCALUCP's minimum open space requirements, so would development of Alternative 5, since the Reduced Acreage Alternative would fall within the portion of Alternative 1 that would occur south of I-10. All remaining development under Alternative 5 south of I-10 would mirror Alternative 1; as such, the analysis for Alternative 1 in this area would apply. The FAA issued "No Hazard to Air Navigation" Determinations for the 230 kV gen-tie line structures.

The findings from the Glare Study, as well as simulated animations, were presented to the ALUC. On April 2012, the ALUC found Alternative 1 to be consistent with the RCALUCP. As Alternative 5 would develop a portion of the Alternative 1 site, Alternative 5 would be consistent with the RCALUCP determination, as well.

Decommissioning

During decommissioning, substantial quantities of solid wastes (concrete, metal) and industrial wastes (dielectric insulating oil, diesel fuel) could result from dismantling Alternative 5, similar to Alternative 1. The analysis under Alternative 1 would apply.

Application of CEQA Significance Thresholds

HAZ-1) Would Alternative 5 create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Similar to Alternative 1, Alternative 5 would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. The hazardous materials used during the construction phase would be typical of most construction projects of this type. Hazardous materials would be stored, managed, and disposed of per requirements of the Riverside County Fire Department, Riverside County Office of Emergency Services, DTSC, and CUPA. In addition, BMPs listed above would be implemented to minimize or avoid impacts related to the routine transport, use, or disposal of hazardous materials. Alternative 5 would avoid the removal of two structures that would be impacted by Alternative 1—APNs 821-120-026 (shop) and 821-120-039 (shop). Alternative 5 would require the removal of a residential structure on APN 863-100-016. The residence was constructed prior to or during the 1970s; therefore, it is very likely that the building materials used for the structure contain ACM and/or LBP. With implementation of Mitigation Measures Hazards-1 and Hazards-2, impacts regarding the transport, use, and handling of hazardous materials during construction and operation of Alternative 5 would be reduced to less than significant levels. It is anticipated that impacts from decommissioning would be similar to construction; however, decommissioning would not impact ACM or LBP.

HAZ-2) Would Alternative 5 create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Similar to Alternative 1, Alternative 5 would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. As such, the HAZ-2 analysis under Alternative 1 would apply.

HAZ-3) Would Alternative 5 emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Similar to Alternative 1, Alternative 5 would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. As such, the HAZ-3 analysis under Alternative 1 would apply.

HAZ-4) Would Alternative 5 be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment?

One aboveground storage tank was located within the Alternative 1 solar facility site. This site is north of I-10, outside of the Alternative 5 development footprint. No impact would occur.

HAZ-5) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would Alternative 5 result in a safety hazard for people residing or working in the project area?

Similar to Alternative 1, Alternative 5 would be within an existing airport land use plan. The HAZ-5 analysis for Alternative 1 would apply.

HAZ-6) For a project within the vicinity of a private airstrip, would Alternative 5 result in a safety hazard for people residing or working in the project area?

Alternative 5 would not be within the vicinity of a private airstrip; therefore, no impact would occur.

HAZ-7) Would Alternative 5 impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Alternative 5 would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; therefore, no impact would occur.

HAZ-8) Would Alternative 5 expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Alternative 5 would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires; therefore, no impact would occur.

HAZ-9) Would Alternative 5 result in an inconsistency with an Airport Master Plan?

Similar to Alternative 1, Alternative 5 would not conflict with the RCALUCP. The HAZ-9 analysis for Alternative 1 would apply.

HAZ-10) Would Alternative 5 require review by the Airport Land Use Commission?

See HAZ-9 above.

Cumulative Impacts

Geographic Scope

The geographic scope considered for cumulative impacts from health, safety, and hazardous materials/fire and fuels management is the area within one mile of the boundary of the study area. One mile is the American Society of Testing and Materials standard search distance for hazardous materials and captures all areas within which a receptor might be expected to experience hazard impacts from the Project along with hazard impacts of other projects. This one-mile standard distance was also applied to other potential safety risks associated with fire and fuels management.

Temporal Scope

The temporal scope refers to the duration over which an impact would occur: short-term or long-term; for example, only during the months of construction, only during operation and maintenance, or during both phases. This limits the projects whose impacts are to be analyzed in the cumulative effects analysis to those that would cause impacts at the same time as the BMSP. Determining the temporal scope requires estimating the length of time the effects of the proposed action would last, either individually or in combination with other anticipated effects. The temporal scope of impacts to hazards and hazardous materials would be during the development of cumulative projects through the end of Project decommissioning, because any direct or indirect effects of the Project would only occur during the life of the Project. The temporal scope of the cumulative impact analysis includes related project construction schedules that overlap with those of the BMSP and the operation of related projects after the construction of the proposed Project has been completed and through the end of Project decommissioning.

Analysis of Direct and Indirect Impacts

Alternative 1: Proposed Project

Construction, Operation, Maintenance, and Decommissioning

Compliance with existing BMP-9 (Hazardous Materials) and agency regulations that address the handling of hazardous materials would ensure that the proposed Project would not create a significant hazard to the public or the environment related to the handling or accidental release of hazardous materials. Past, present, and reasonably foreseeable future projects are also subject to existing agency regulations that address the handling and accidental release of hazardous materials (impact HAZ-1). Therefore, existing agency regulations would ensure that the incremental effects of the Project, when considered together with the effects of past, present, and reasonably foreseeable projects, would not create a cumulatively considerable hazard to the public or environment related to the handling or accidental release of hazardous materials (impact HAZ-2).

Under cumulative conditions, implementation of the proposed Project in conjunction with development of projects listed in Table 4.1-1 is not anticipated to present a public health and safety hazard to residents. Implementation of BMP-3 (Fugitive Dust Abatement Plan) and BMP-9 (Hazardous Materials) would ensure that Project-specific health and safety hazards would be minimized. Additionally, the proposed Project and projects listed in Table 4.1-1 would all involve the storage, use, disposal, and transport of hazardous materials to varying degrees during construction and operation. Impacts from these activities are less than significant for the projects because the storage, use, disposal, and transport of hazardous materials are extensively regulated by various federal, State, and local laws, regulations, and policies. The proposed Project and projects listed in Table 4.1-1 would likely implement and comply with these existing hazardous materials laws, regulations, and policies. Therefore, the projects listed in Table 4.1-1 would not cause a cumulative impact, and the Project would not result in a cumulatively considerable incremental contribution to a cumulative impact related to use or routine transport of hazardous materials (impacts HAZ-1 through HAZ-4).

AR072359

The gen-tie line component of the proposed Project would connect with other off-site proposed and planned transmission infrastructure to the west of the study area and run parallel to these facilities. As a result of this circumstance, the cumulative projects would be contained within the same ROW as the off-site Project facilities and would not subject additional land areas to hazards associated with hazardous materials and fuels management. Thus, the Project's incremental contribution to any potential cumulative impacts would not be considerable.

Alternative 2: No Project Alternative

If the No Project Alternative is implemented, the proposed action Alternatives would not be implemented and the current agricultural practices and expected current use of pesticides, fertilizers, and fuels for farming equipment would remain unchanged.

Alternative 3: Northern 230 kV Gen-tie Line Location

Alternative 3 is similar to Alternative 1 (proposed Project), with the exception of the location of the Northern 230 kV gen-tie line, which would be approximately 700 feet north of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1. As with Alternative 1, compliance with BMP-9 (Hazardous Materials) and existing agency regulations that address the handling of hazardous materials would ensure that Alternative 3 would not create a significant hazard to the public or the environment related to the handling or accidental release of hazardous materials. Past, present, and reasonably foreseeable future projects are also subject to existing agency regulations that address the handling and accidental release of hazardous materials (impact HAZ-1). Therefore, existing agency regulations would ensure that the incremental effects of Alternative 3, when considered together with the effects of past, present, and reasonably foreseeable projects, would not create a cumulatively considerable hazard to the public or environment related to the handling or accidental release of hazardous materials (impact HAZ-2).

Under cumulative conditions, implementation of Alternative 3 in conjunction with development of projects under the cumulative scenario is not anticipated to present a public health and safety hazard to residents. Implementation of BMP-3 (Fugitive Dust Abatement Plan) and BMP-9 (Hazardous Materials) would ensure that Alternative 3-specific health and safety hazards would be minimized. Additionally, development of Alternative 3 and the projects listed in Table 4.1-1 would all involve the storage, use, disposal, and transport of hazardous materials to varying degrees during construction and operation. Impacts from these activities are less than significant for the projects because the storage, use, disposal, and transport of hazardous materials are extensively regulated by various federal, State, and local laws, regulations, and policies. Alternative 3 and the cumulative scenario projects listed in Table 4.1-1 would likely implement and comply with these existing hazardous materials laws, regulations, and policies. Therefore, the projects listed in Table 4.1-1 would not cause a cumulative impact, and Alternative 3 would not result in a cumulatively considerable incremental contribution to a cumulative impact related to use or routine transport of hazardous materials (impacts HAZ-1 through HAZ-4).

The gen-tie line component of this Alternative would connect with other off-site proposed and planned transmission infrastructure to the west of the study area and run parallel to these facilities. As a result of this circumstance, the cumulative projects would be contained within the same ROW as the off-site Project facilities and would not subject additional land areas to hazards associated with hazardous materials and fuels management. Thus, Alternative 3's incremental contribution to any potential cumulative impacts would not be considerable.

Alternative 4: Southern 230 kV Gen-tie Line Location

Alternative 4 is similar to Alternative 1 (proposed Project), with the exception of the location of the Southern 230 kV gen-tie line, which would be approximately 0.8 mile south of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1. As with Alternative 1, compliance with BMP-9 (Hazardous Materials) and existing agency regulations that address the handling

of hazardous materials would ensure that Alternative 4 would not create a significant hazard to the public or the environment related to the handling or accidental release of hazardous materials. Past, present, and reasonably foreseeable future projects are also subject to existing agency regulations that address the handling and accidental release of hazardous materials (impact HAZ-1). Therefore, existing agency regulations would ensure that the incremental effects of Alternative 4, when considered together with the effects of past, present, and reasonably foreseeable projects, would not create a cumulatively considerable hazard to the public or environment related to the handling or accidental release of hazardous materials (impact HAZ-2).

Under cumulative conditions, implementation of Alternative 4 in conjunction with development of projects under the cumulative scenario is not anticipated to present a public health and safety hazard to residents. Implementation of BMP-3 (Fugitive Dust Abatement Plan) and BMP-9 (Hazardous Materials) would ensure that Alternative 4-specific health and safety hazards would be minimized. Additionally, development of Alternative 4 and the projects listed in Table 4.1-1 would all involve the storage, use, disposal, and transport of hazardous materials to varying degrees during construction and operation. Impacts from these activities are less than significant for the projects because the storage, use, disposal, and transport of hazardous materials are extensively regulated by various federal, State, and local laws, regulations, and policies. Alternative 4 and the cumulative scenario projects listed in Table 4.1-1 would likely implement and comply with these existing hazardous materials laws, regulations, and policies. Therefore, the projects listed in Table 4.1-1 would not cause a cumulative impact, and Alternative 4 would not result in a cumulatively considerable incremental contribution to a cumulative impact related to use or routine transport of hazardous materials (impacts HAZ-1 through HAZ-4).

The gen-tie line component of this alternative would be approximately 0.8 mile south of Alternative 1's proposed 230 kV gen-tie line. However, cumulative scenario projects would likely connect with other proposed and planned transmission infrastructure to the west of the study area and run parallel to these facilities. As a result of this circumstance, the cumulative projects would be contained within the same ROW as the off-site Project facilities and would not subject additional land areas to hazards associated with hazardous materials and fuels management. Thus, Alternative 4's incremental contribution to any potential cumulative impacts would be greater than the proposed Alternatives 1 and 3, but would not be considerable.

Alternative 5: Reduced Acreage Alternative

Construction, Operation, Maintenance, and Decommissioning

Similar to Alternative 1, compliance with BMP-9 (Hazardous Materials) and existing agency regulations, under Alternative 5, that address the handling of hazardous materials would ensure that Alternative 5 would not create a significant hazard to the public or the environment related to the handling or accidental release of hazardous materials. Past, present, and reasonably foreseeable future projects are also subject to existing agency regulations that address the handling and accidental release of hazardous materials (impact HAZ-1). Therefore, existing agency regulations would ensure that the incremental effects of Alternative 5, when considered together with the effects of past, present, and reasonably foreseeable projects, would not create a cumulatively considerable hazard to the public or environment related to the handling or accidental release of hazardous materials (impact HAZ-2).

Under cumulative conditions, implementation of Alternative 5 in conjunction with development of projects listed in Table 4.1-1 is not anticipated to present a public health and safety hazard to residents. Implementation of BMP-3 (Fugitive Dust Abatement Plan) and BMP-9 (Hazardous Materials) would ensure that Alternative 5-specific health and safety hazards would be minimized. Additionally, Alternative 5 and projects listed in Table 4.1-1 would all involve the storage, use, disposal, and transport of hazardous materials to varying degrees during construction and operation. Impacts from these activities are less than significant for the projects because the storage, use, disposal, and transport of hazardous materials are extensively regulated by various federal, State, and local laws, regulations, and policies. Alternative 5 and projects listed in Table 4.1-1 would likely implement and comply with these existing hazardous materials laws, regulations, and policies. Therefore, the projects listed in Table 4.1-1 would not cause a cumulative impact, and Alternative 5 would not result in a cumulatively considerable incremental

AR072361

contribution to a cumulative impact related to use or routine transport of hazardous materials (impacts HAZ-1 through HAZ-4).

The gen-tie line component of Alternative 5 would connect with other off-site proposed and planned transmission infrastructure to the west of the study area and run parallel to these facilities. As a result of this circumstance, the cumulative projects would be contained within the same ROW as the off-site Alternative 5 facilities and would not subject additional land areas to hazards associated with hazardous materials and fuels management. Thus, Alternative 5's incremental contribution to any potential cumulative impacts would not be considerable.

Mitigation Measures

Hazards-1 Prior to issuance of permits for any demolition activity involving the removal of structures that may contain ACM, an asbestos survey and sampling shall be conducted for existing structures. If ACM are present, they shall be abated in compliance with SCAQMD Rule 1403. Additionally, SCAQMD would be notified prior to any structure renovation or demolition pursuant Rule 1403 (d)(1)(B).

Hazards-2 Prior to issuance of permits for any demolition activity involving structures that may contain LBP, a LBP assessment of each existing structure shall be conducted. LBP found within the Project area shall be removed and disposed of as a hazardous waste in accordance with all applicable regulations.

Residual Impacts

With implementation of the above-listed BMPs as part of the Project and Mitigation Measures Hazards-1 and Hazards-2, the Project would result in less than significant impacts from hazards and hazardous materials.

NEPA Conclusions

The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged. The Project and each of the action Alternatives would comply with federal, State, and local laws, regulations, and policies for hazardous waste and materials. With implementation of BMPs and Mitigation Measures Hazards-1 and Hazards-2, the Project and each of the action Alternatives would not create a significant hazard to the public or the environment related to the handling or accidental release of hazardous materials, use or routine transport of hazardous materials, or subject additional land areas to hazards associated with hazardous materials and fuels management.

4.2.9 Hydrology and Water Quality

This section describes the impact analysis relating to hydrology and water quality for the proposed Project and Alternatives. Additional information on water supply for the Project can be found in the *Water Supply Assessment for the Blythe Mesa Solar Project*, prepared by POWER Engineers, Inc. 2013 (provided in Appendix G of this Draft EIR/EA). Information regarding the floodplain was obtained from the *Blythe Mesa CUP 03685 Wash Feature Summary of Findings* (Appendix H of this Draft EIR/EA).

Methodology for Analysis

To assess potential effects of the proposed Project and Alternatives related to hydrology and water quality, water resources on the proposed solar facility site and within the area were inventoried to allow a location-specific analysis of temporary and permanent effects of the proposed Project. Potential effects to hydrology and water quality include temporary (i.e., construction-related and those related to decommissioning) effects and long term (i.e., operational) effects. When evaluating potential effects of the proposed Project resulting from construction, operation and maintenance, and decommissioning of the Project, it was assumed that the Project would comply with all applicable federal, State, and local regulatory requirements and permits that protect surface water and groundwater.

CEQA Significance Criteria

In compliance with CEQA requirements, determinations were made regarding the significance of each identified impact that would potentially result from construction and operation of the proposed Project. Appropriate criteria derived from the CEQA Guidelines have been identified and utilized to make these significance determinations. Potential impacts are assessed and determined to be either of no impact, less than significant impact, less than significant impact with implementation of mitigation measures, or significant impact. Impacts resulting from the proposed Project would be considered significant and would require mitigation if the Project would:

HYD-1) Violate any water quality standards or waste discharge regulations.

HYD-2) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted).

HYD-3) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site.

HYD-4) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site.

HYD-5) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.

HYD-6) Otherwise substantially degrade water quality.

HYD-7) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map.

HYD-8) Place within a 100-year flood hazard area structures which would impede or redirect flood flows.

HYD-9) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam.

HYD-10) Be at risk of inundation by seiche, tsunami, or mudflow.

The following additional significance criteria from the County of Riverside CEQA Environmental Assessment Form are used in the analysis. A project could have potentially significant impacts if it would:

HYD-11) Include new or retrofitted Stormwater Treatment Control BMPs (e.g., water quality treatment basins, constructed treatment wetlands), the operation of which could result in significant environmental effects (i.e., increased vectors and/or odors).

HYD-12) Cause changes in absorption rates or the rate and amount of surface runoff.

HYD-13) Cause changes in the amount of surface water in any water body.

NEPA Requirements

Pursuant to NEPA, this analysis is intended to compare the Alternatives and identify any adverse effects to water resources that cannot be avoided. Adverse effects may be direct, indirect, or cumulative. Potential direct and indirect effects of the proposed Project and Alternatives are analyzed below and discussed as construction-related, operation- and maintenance-related, and decommissioning effects.

Applicable Best Management Practices

As part of the Project and Alternatives, the following applicable BMPs would minimize the environmental impacts to hydrology and water quality. The full BMPs have been detailed below (see also Table 2-4 in Chapter 2) and are further referenced (by number) within the impact discussion.

NUMBER	BMP DESCRIPTION
BMP-1	**Drainage, Erosion, and Sedimentation Control Plan**. As part of the County of Riverside's Conditional Use Permit (CUP) requirements, a Drainage, Erosion, and Sedimentation Control Plan would be developed for the Project. The plan would address the drainage, erosion, and sediment control requirements to support all activities associated with construction, operation, maintenance, and decommissioning of the Project. For example, any stockpiles created would be kept on-site, with an upslope barrier in place to divert runoff. Stockpiles would be sprayed with water, covered with tarpaulins, and/or treated with appropriate dust suppressants, especially in preparation for high wind or storm conditions. Certified weed-free straw bale barriers would be installed to control sediment in runoff water; straw bale barriers would be installed only where sediment-laden water can pond, thus allowing the sediment to settle out. Topsoil from the site would be stripped, stockpiled, and stabilized before excavating earth for facility construction. Topsoil would be segregated and spread on freshly disturbed areas to reduce color contrast and aid rapid revegetation.
BMP-2	**Stormwater Pollution Prevention Plan.** In compliance with requirements of the National Pollutant Discharge Elimination System (NPDES) permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and prepared for the Project to ensure that protection of water quality and soil resources is consistent with County and State regulations. The plan would identify site surface water runoff patterns and include measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Project area and Project-related construction areas, and would also include measures for non-stormwater discharge and waste management. The SWPPP would cover all activities associated with the construction of the Project, including clearing, grading, and other ground disturbance such as stockpiling or excavation erosion control. The plan would prevent off-site migration of contaminated stormwater, changes in pre-Project storm hydrographs, or increased soil erosion.
BMP-3	**Fugitive Dust Abatement Plan.** As required by the Mojave Desert Air Quality Management District Rule 403, a Fugitive Dust Abatement Plan would be prepared to address fugitive dust emissions during Project construction, operation, maintenance, and decommissioning. The plan would include measures to minimize fugitive dust emissions from wrecking, excavation, grading, clearing of land, and solid waste disposal operations, and would take every reasonable precaution to prevent visible particulate matter from being deposited upon public roadways as a direct result of operations. During construction, all unpaved roads, disturbed areas (e.g., areas of scraping, excavation, backfilling, grading, and compacting), and loose materials generated during Project construction activities would be watered as frequently as necessary to minimize fugitive dust generation. However, the amount of water will be minimized each time to prevent temporarily ponding water that may occur as a result of the fugitive dust plan. In water-deprived locations, water spraying would be limited to active disturbance areas only, and non-water-based dust control measures would be implemented in areas with

NUMBER	BMP DESCRIPTION
	intermittent use or use that is not heavy, such as stockpiles or access roads. Alternatively, chemical dust suppressants or durable polymeric soil stabilizers could be used. The dust suppression measures would consider the sensitivity of wildlife to the windborne dispersal of fugitive dust containing dust suppressants and the potential impact on future reclamation.
BMP-9	**Hazardous materials.** As required by the Clean Air Act, Section 401 of the Clean Water Act, the Toxic Substance Control Act, and the Hazardous Materials Transportation Act, all vehicles and equipment must be in proper working condition to ensure that there is no potential for fugitive emissions or accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, or other hazardous materials. Equipment must be checked for leaks prior to operation and repaired as necessary. Refueling of equipment must take place on existing paved roads, where possible, and not within or adjacent to drainages. Hazardous spills must be cleaned up immediately. Contaminated soil would be disposed of at an approved offsite landfill, and spills reported to the permitting agencies. Service/maintenance vehicles should carry appropriate equipment and materials to isolate and remediate leaks or spills, and an on-site spill containment kit for fueling, maintenance, and construction will be available. Cleaning of construction vehicles at commercial car washes should be considered rather than washing vehicles on the Project area so that dirt, grease, and detergents are treated effectively at existing facilities designed to handle those types of wastes.
BMP-10	**Integrated Weed Management Plan.** In compliance with the Federal Noxious Weed Act and the Plant Protection Act, a Project-specific integrated weed management plan for the control of noxious weeds and invasive plant species would be prepared. The plan would identify presence, location, and abundance of weed species in the Project area and surrounding area adjacent to the Project, as well as identify suppression and containment measures to prevent the spread of weed species and introduction of weed species. Prevention techniques would include: limiting disturbance areas during construction to the minimum required to perform work; limiting ingress and egress to defined routes; maintaining vehicle wash and inspection stations; and closely monitoring the types of materials brought on-site to minimize the potential for weed introduction. During operations, noxious and invasive weed management will be incorporated as a part of mandatory site training for groundskeepers and maintenance personnel. Training will include weed identification and the impacts on agriculture, wildlife, and fire frequencies. Training will also cover the importance of preventing the spread of noxious weeds and of controlling the proliferation of existing weeds.
BMP-11	**Project structures, gen tie line, and building surfaces.** Project facilities would be sited to ensure that there is adequate space (i.e., setbacks of no less than 100 feet) between solar facilities and natural washes. These setbacks would preserve and maintain the natural washes' hydrological functions. The color and finish of Project structure and building surfaces that are visible to the public will be designed to ensure minimal visual intrusion, contrast, and glare. Grouped structures will be painted the same color to reduce visual complexity and color contrast. Solar panel backs will be color-treated to reduce visual contrast with the landscape setting. Materials, coatings, or paints having little or no reflectivity will be used wherever possible. The visual color contrast of graveled surfaces will be reduced with approved color treatment practices.
BMP-13	**Ground and surface disturbance.** Construction boundaries would be clearly delineated to minimize areas of ground and surface disturbance. Ground-disturbing activities shall be minimized, especially during the rainy season. To the maximum extent possible, construction-related activities (such as vehicle and foot traffic) would avoid areas with intact biological soil crusts. For cases in which impacts cannot be avoided, soil crusts would be salvaged and restored on the basis of recommendations by the County of Riverside and BLM once construction has been completed. Existing rocks, vegetation, and drainage patterns shall be preserved to the maximum extent possible. No paint or permanent discoloring agents shall be applied to rocks or vegetation (to indicate surveyor construction activity limits or for any other purpose). All stakes and flagging shall be removed from the construction area and disposed of in an approved facility. Where feasible, brush-beating, mowing, or use of protective surface matting rather than removing vegetation shall be employed. Clearing and disturbing of sensitive areas (e.g., steep slopes and natural drainages) and other areas shall be avoided outside the construction zone. Surface disturbance would be minimized by utilizing undulating surface disturbance edges; stripping, salvaging, and replacing topsoil; using contoured grading; controlling erosion; using dust suppression techniques; and restoring exposed soils to their original contour and vegetation.
BMP-14	**Travel and traffic.** Vehicular traffic on-site shall be confined to existing or designated travel routes and designated work areas. Access to the construction site and staging areas shall be limited to authorized vehicles and only through the designated roads. The extent of habitat disturbance during construction shall be reduced by keeping vehicles on access roads and minimizing foot and vehicle traffic through undisturbed areas. To the

NUMBER	BMP DESCRIPTION
	extent practical, travel shall be limited to stabilized roads. Road maintenance activities shall avoid blading existing forbs and grasses in ditches and adjacent to roads. Abandoned roads and roads no longer needed shall be subsoiled to increase infiltration and reduce soil compaction, then recontoured and revegetated. Construction traffic shall avoid unpaved surfaces to the extent practical (to reduce the risk of compaction) and reduce speed to lessen fugitive dust emissions. On unpaved or unstabilized surfaces within the construction site, speed limits (e.g., 20 mph) shall be posted with visible signs and enforced to minimize airborne fugitive dust. Project vehicle speeds shall be limited in areas occupied by special-status animal species. Traffic shall stop to allow wildlife to cross roads. Shuttle vans or carpooling shall be used to reduce the amount of traffic on access roads. Workers shall be trained to comply with the speed limit, use good engineering practices, minimize the drop height of materials, and minimize the number and extent of disturbed areas. The Project developer shall enforce these requirements.
BMP-15	**New access roads and parking lots.** New access roads shall be designed and constructed to the appropriate road design standards, such as those described in BLM Manual 9113 or County standards, whichever is applicable. New access roads shall be designed to follow natural land contours in the Project area and avoid existing desert washes. The specifications and codes developed by the U.S. Department of Transportation (DOT) and County of Riverside Transportation Department are also to be taken into account. Primary access roads and parking lots shall be surfaced with aggregate that is hard enough that vehicles cannot crush it and thus cause dust or compacted soil conditions. Paving may also be used on access roads and parking lots. Alternatively, chemical dust suppressants or durable polymeric soil stabilizers would be used on these locations.

Alternative 1: Proposed Project

Analysis of Direct and Indirect Impacts

Construction

Water Quality

Construction of the solar facility, gen-tie lines, new substations, access roads, and O&M buildings would require ground-disturbing activities, including clearing and grading for structure installation work areas, and access for construction. Disturbed soils accelerate erosion and increase sediment in stormwater runoff to receiving waters, causing increased turbidity and sedimentation if not managed appropriately. Construction-related erosion and sedimentation as a result of soil disturbance would be minimized as part of the Project with preparation of a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) and Stormwater Pollution Prevention Plan (BMP-2). Construction of the proposed Project would not permanently alter the course of any of the drainages. Additionally, fuel, oil, and other fluids used in construction vehicles, equipment, and heavy machinery could enter drainages via storm flow and contaminate water, introducing additional sources of polluted stormwater runoff. The potential for accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, and other hazardous materials would be minimized as part of the Project with implementation of BMP-2 and BMP-9.

Ground disturbance related to construction of the Project could potentially degrade water quality through the inadvertent release of residual pesticides from former agricultural lands. All pesticides used in the United States must be registered (licensed) by the EPA, which requires that pesticides would not cause unreasonable harm to the environment. Registered pesticides must be used in accordance with directions contained on the label of the product. The Project would not include the use of pesticides during construction or operation. While the Project may involve the use of herbicides as part of the Integrated Weed Management Plan (BMP-10), herbicides would be applied in accordance with all recommended or required application procedures.

Hazardous material storage and management would be implemented in accordance with requirements set forth by the Riverside County Fire Department (RCFD), Riverside County Office of Emergency Services, DTSC, and CUPA for storage and handling of hazardous materials. As part of the Project, the potential for accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, and other hazardous

AR072366

materials would be minimized with implementation of BMP-9. In addition, construction activities would occur according to Occupational Safety and Health Administration (OSHA) regulatory requirements; therefore, it is not anticipated that construction activities for the proposed Project would release hazardous materials, substances, or waste.

Surface Water, Groundwater, and Water Supply

An ephemeral drainage bisects the gen-tie line and a portion of the solar facility site and may be affected by construction, operation, or maintenance of the proposed Project. The solar panels have been designed to avoid placement within the ephemeral drainage; however, one gen-tie pole would be within the potential ordinary high water mark of the drainage. Construction of the new substations (approximately 90,000 square feet each), O&M buildings (approximately 3,500 square feet each), and equipment pads (approximately 360 square feet each) would introduce new areas of impermeable surfaces that would potentially interfere with groundwater recharge within the groundwater basin. The two primary access roads (Seeley Avenue and Riverside Drive) to the O&M buildings would be improved for approximately 100 feet and would be 16 to 20 feet wide. The interior access roads within the solar facility site would be unpaved and pervious. The new impermeable surface areas would not result in substantial negative effects on groundwater recharge due to the high proportion of permeable surfaces that would remain. Construction of the interior unpaved access roads and use of heavy equipment and vehicles across the Project area could result in soil compaction, which could increase surface water runoff rates and quantities, as well as decrease the rate at which water is able to percolate through the ground. As part of the Project, soil compaction would be reduced through minimization of ground disturbance (BMP-13) and use of aggregate for new access roads (BMP-15).

Based on the 2010 Palo Verde Irrigation District (PVID) records, irrigation of the agricultural fields on the proposed solar facility site used approximately 12,000 AF per year (AF/yr) of surface water. It is assumed that Project construction would not involve the use of groundwater pumped from existing wells on-site. During the 36-month (three-year) construction period for the proposed Project, the water supply supplied by the PVID would be reduced to approximately 1,354 AF of water compared to earlier agricultural uses (totaling approximately 1,354 AF over the three-year construction period). Construction water would be used for dust suppression, concrete manufacturing, and fire safety. Accordingly, there would be a beneficial impact to the water supply via reduced need for water.

Existing Drainage Patterns

Project facilities would be sited to provide adequate setbacks between most solar facility components (solar panels, gen-tie lines, substations, access roads, and O&M buildings) and ephemeral drainages (BMP-11). These setbacks would preserve and maintain the hydrological functions of the drainage to the extent possible (see Figure 3.2.9-1 *Floodplain Delineation*). Construction of the Project would require ground-disturbing activities, including solar array installation, substation and O&M building construction, and construction of access roads. Grading could potentially alter naturally occurring drainage patterns and result in soil erosion, sedimentation, long-term siltation, and increased stormwater runoff, which increases the potential for flooding off-site or downstream of the construction areas. However, the Project area is relatively flat and would not require mass grading for construction purposes. The majority of the existing topography at the Project area would be maintained and, therefore, no added storm drainage control would be required outside of the substations and switching station. Stormwater drainage inside the substations and switching station would be designed to minimize erosion and sediment-laden runoff, as described in mitigation measure Hydrology-4. Blading and other methods of vegetation removal for clearance of roads and construction areas decrease the ability of the soil to absorb water, which also increases stormwater runoff from such disturbed areas. As part of the Project, BMP-1 (Drainage, Erosion, and Sedimentation Control Plan) and BMP-2 (Stormwater Pollution Prevention Plan) would be implemented; this would minimize impacts from storm water runoff and existing drainage patterns. In addition, the minimization of ground and surface disturbance (BMP-13), limitation of vehicle travel and traffic (BMP-14), and limited construction of new access roads and parking lots (BMP-15) would minimize impacts to the existing drainage patterns.

AR072367

Operation and Maintenance

Water Quality

The new substations and O&M buildings would create new areas of impermeable surfaces, which have the potential to increase the rate of stormwater runoff, leading to increased erosion and long-term siltation and flooding downstream of the new impermeable areas, and contribute additional sources of polluted runoff. As part of the Project, however, BMP-1 and BMP-2 would be implemented, which would minimize impacts to water quality that would result from erosion and increased turbidity and sedimentation downstream. Maintenance of access roads and structure pads (e.g., gravelling and vegetation clearance) would contribute additional sources of runoff. As part of the Project, BMP-13 through BMP-15 would be implemented, which would also minimize potential impacts from runoff.

The O&M buildings would generate a minimum volume of wastewater as result of daily activities. Wastewater would be treated via a septic system permitted through the Riverside County Department of Environmental Health Services, and would be in compliance with Department requirements.

Groundwater and Water Supply

The Project would require a limited amount of water for periodic washing of the solar panels, fire water supply, and supply for the operations and maintenance buildings. A total of up to 345 AF per year of non-potable water would be required for Project operation, which is well below the existing (pre-Project) irrigation use of approximately 12,000 AF/yr. Water for the Project would be taken from existing PVID water entitlements that support the agricultural operations currently on the proposed solar facility site; current operations are not supported by groundwater wells. Riverside County Community Service Area #122 (CSA #122) has issued a will-serve letter for the Project's limited potable water needs. Less than one AF of groundwater per year would be required for potable use in the two O&M buildings.

The water supply from PVID sources and CSA #122 is sufficient to meet requirements of the proposed Project, including the minor potable groundwater demand under average-year, single-dry year, and multiple-dry year conditions over a 20-year future projection (refer to Appendix G, *Water Supply Assessment*).

Flood Hazards

The Project would be in an area designated by the Federal Emergency Management Agency (FEMA) as Zone D, which is reserved for areas where there are possible but undetermined flood hazards, and where no FEMA flood hazard analysis has been conducted. However, the Project would be on the Palo Verde Mesa, which is on high ground, at an elevation approximately 50 feet above the historic floodplain of the Colorado River (i.e., the Palo Verde Valley). Additionally, the Project would be approximately eight miles west of the current channel of the Colorado River, and it is unlikely floodwaters associated with the Colorado River that floodwaters would affect the Project.

The ephemeral drainage that bisects the southern portion of the proposed solar facility site was analyzed to determine the depth and extent of a 100-year flood hazard area associated with this drainage (see Appendix H *Blythe Mesa CUP 03685 Wash Feature Summary of Findings*). The extent of the floodplain for this area is delineated in Figure 3.2.9-1 *Floodplain Delineation*. The analysis determined a 100-year flood flow would have a flow velocity of 5,557 cubic feet per second and, given the wide, flat nature of the topography, flood depths would be shallow (3.71 feet maximum depth) and average stream velocities would vary from 6.8 feet per second (4.6 mph) to 2.4 feet per second (1.6 mph) outside of the main channel, and scour would be minimal. Based on the results of this analysis, solar panels, associated hardware, and substation foundations could be elevated to provide additional clearance above the calculated 100-year flood depth, and structured that could not be relocated (e.g., transmission line structures) would be designed to withstand potential flood hazards.

This ephemeral drainage would be crossed by the gen-tie line; the width of the calculated floodplain would preclude the floodplain from being crossed in a single span, and one pole structure would be sited

within the limits of the potential ordinary high water mark, as estimated by field personnel from the USACE. The Project would obtain a Nationwide Permit 12 from the USACE for the placement of the pole structure within the potential ordinary high water mark.

The Project would not be located in the vicinity of a levee or dam, nor would the Project be located such that it would expose people or structures to significant risk of loss, injury, or death involving flooding.

The Project would not be in a location that could be affected by a tsunami or seiche. The Project would be in an area characterized by well-drained soils and low precipitation and would not be within a State of California Earthquake Fault Zone for known active faults, and no known or potentially active faults are mapped within the vicinity of the Project area (the nearest active fault is approximately 58 miles away).

Decommissioning

Activities associated with decommissioning are similar to construction; therefore, effects related to hydrology and water quality associated with decommissioning would be similar to construction-related effects of the proposed Project.

Application of CEQA Significance Thresholds

HYD-1) Would the Project violate any water quality standards or waste discharge regulations?

Temporary, direct impacts to water quality could result from stormwater runoff during construction and operation of the Project, resulting in erosion and increased turbidity and sedimentation downstream if not managed appropriately. In addition, stormwater runoff could transport fuel, oil, and other fluids into drainages via stormwater flow. As part of the Project, BMP-1, BMP-2, BMP-9, BMP-13, BMP-14, and BMP-15 would be implemented to minimize potential impacts to water quality from sedimentation, turbidity, and oil/chemical contamination. Implementation of Mitigation Measure Hydrology-1 would further reduce these potential impacts to a less than significant level.

HYD-2) Would the Project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction and operation of the O&M buildings, substations, and equipment pads would create new areas of impermeable surfaces that could potentially interfere with groundwater recharge; however, the new impermeable surfaces would be minimal in comparison to the total solar facility area which would be left in a pervious condition and would not significantly interfere with groundwater recharge. Water supplies required for construction, operation, and maintenance of the Project would be provided by PVID water entitlements that currently support the agricultural operations on-site; these operations are not currently supported by groundwater wells. The Watershed Supply Assessment conducted for the Project determined that adequate water supplies exist to serve the Project over the life of the Project (construction, operation and maintenance, and decommissioning). The great majority of water for the proposed Project (i.e., all of the non-potable water) would not be delivered by a public water system or using public water system connections. The proposed Project would use existing water infrastructure that currently delivers irrigation water from the PVID. Riverside County Community Service Area #122 (CSA #122) has substantiated its intention to provide this potable supply by issuing a will-serve letter (October 26, 2012 c/o Steve H. Jones – Manager) for the Project's limited potable water needs. CSA #122 has provided a will-serve letter for the small amount (up to 150 gallons per day) of potable water for the two O&M buildings. The Project would result in a beneficial increase in available PVID water supply due to the reduction in water demand for the Project compared to existing agricultural use. No impact

HYD-3) Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

An ephemeral drainage bisects the gen-tie line and the southern portion of the proposed solar facility site; however, Project design includes buffers between Project facilities and natural washes, as described in BMP-11. Although on-site grading would be minimized, the installation of proposed facilities, including roads, fencing, solar arrays, and towers along the transmission corridor, could interfere with existing drainage patterns on-site. Any necessary grading would follow existing contours as feasible to minimize alteration of existing drainage patterns (BMP-11). Erosion and sedimentation would be minimized through implementation of the Project Drainage, Erosion, and Sedimentation Control Plan (BMP-1), as well as the required Project SWPPP (BMP-2), and other measures as described in Mitigation Measures Hydrology-1 through Hydrology-4. Implementation of the BMPs, as part of the Project, and mitigation measures would reduce these impacts to less than significant.

HYD-4) Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

As described in HYD-2, the creation of impermeable surfaces relative to the Project area would be nominal. The proposed Project would result in slight alterations in the existing drainage pattern of the site or area (refer to discussion in HYD-3). The Project would be in an area characterized by well-drained soils and low precipitation, and any necessary grading would follow existing contours as feasible to minimize alteration to the existing drainage patterns as described in HYD-3. Designed setbacks, as described in BMP-11, would also minimize alterations to drainage patterns of the ephemeral wash and its associated floodplain, further reducing the potential for flooding on- or off-site. Therefore, there is low potential for flooding on- or off-site during construction, operation, maintenance, and decommissioning of the Project. Impacts would be less than significant.

HYD-5) Would the Project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Creation of new permanent access roads (both paved and unpaved) and construction of the substations, O&M buildings, and equipment pads, along with grading for installation of the solar array, would create additional sources of runoff. Likewise, grading for construction of the solar facility would potentially contribute additional sources of runoff. As part of the Project BMPs discussed above, impacts related to the introduction of additional sources of polluted runoff would be minimized. The majority of the original grades and natural drainage features within the solar facility site and gen-tie line corridor would be maintained; within the substations and switching station, stormwater drainage would be designed to minimize erosion and sediment-laden runoff as well as control the flow of water leaving the property to minimize potential for erosion and flooding off-site, as described in mitigation measure Hydrology-4. Impacts would be less than significant.

HYD-6) Would the Project otherwise substantially degrade water quality?

Ground disturbance related to construction of the Project would potentially degrade water quality through the inadvertent release of hazardous materials, pesticides, and herbicides.

While Project construction and operation could include use or application of hazardous materials or wastewater with potential to degrade water quality, compliance with all applicable regulations and permit requirements would reduce the potential impacts to a less than significant level.

HYD-7) Would the Project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

The proposed Project would not include the construction of any residential units, and would not introduce new housing to the area. No impact would occur.

HYD-8) Would the Project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

The Project would be on the Palo Verde Mesa, at an elevation approximately 50 feet above the historic floodplain of the Colorado River (i.e., Palo Verde Valley approximately eight miles west of the current channel of the Colorado River) and would be unlikely to impede or redirect flood flows associated with the Colorado River. The Project would relocate or elevate Project components to avoid placing structures within the 100-year flood hazard area associated with the ephemeral drainage; gen-tie line structures that could not be relocated would be designed to withstand flood flows to the extent possible to minimize potential of these structures to impede or redirect flood flows. Implementation of Mitigation Measures Hydrology-5 and Hydrology-6 would reduce impacts during construction, operation, maintenance, and decommissioning to less than significant levels.

HYD-9) Would the Project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

The Project would not be located in the vicinity of a levee or dam. Portions of the Project would be located in a floodplain, such that it would expose people or structures to significant risk of loss, injury, or death involving flooding. However, with implementation of Mitigation Measures Hydrology-5 and Hydrology-6 would reduce impacts during construction, operation, maintenance, and decommissioning to less than significant levels.

HYD-10) Would the Project be at risk of inundation by seiche, tsunami, or mudflow?

The Project would not be sited in a location that could be affected by a tsunami or seiche. The Project would be sited in an area characterized by well-drained soils and low precipitation, which is not within a State of California Earthquake Fault Zone for known active faults, and no known or potentially active faults are mapped within the vicinity of the Project area. The Project would not be affected by or result in a mudflow; no impact would occur.

HYD-11) Would the Project include new or retrofitted Stormwater Treatment Control BMPs (e.g., water quality treatment basins, constructed treatment wetlands), the operation of which could result in significant environmental effects (i.e., increased vectors and/or odors)?

No storm water drainage system exists on the Project area. Construction of the proposed Project would include implementation of a SWPPP (BMP-2). The plan would specify measures that would minimize or avoid potential effects associated with storm water runoff. Operation and maintenance would not introduce new infrastructure or alter existing surface water and drainage patterns beyond what occurred during the construction period. Therefore, impacts would be less than significant.

HYD-12) Would the Project cause changes in absorption rates or the rate and amount of surface runoff?

See HYD-3 and HYD-4 above. The proposed Project would cause slight changes in the absorption rates and amount of surface water to on-site or off-site drainages. Implementation of Mitigation Measures Hydrology-3 and Hydrology-4 would reduce potential impacts resulting from runoff and absorption rates.

HYD-13) Would the Project cause changes in the amount of surface water in any water body?

See HYD-2 above. The proposed Project would reduce the amount of water used on-site compared to existing agricultural use, which would not have an adverse effect on Colorado River water supplies or diversions.

Alternative 2: No Project Alternative

Under the No Project Alternative, no new construction and/or operational activities would result, and no new impacts would occur. However, the existing agricultural use on the Project area would continue to utilize a greater amount of water than the action Alternatives, resulting in a negative impact to water supplies as compared to the action Alternatives.

Alternative 3: Northern Alternative 230 KV Gen-tie Line Location

Similar to Alternative 1, Alternative 3 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 3 is the location of the proposed 230 kV gen-tie alignment within the solar facility to the Colorado River Substation. Within the solar field, the same 230 kV gen-tie alignment would be used for both Alternatives 1 and 3; however, the gen-tie alignment for Alternative 3 would be shifted to the north, but primarily within the same BLM utility corridor and within the SEZ, and entirely on BLM-managed lands. All direct and indirect impacts to groundwater, water supply, water quality, drainage patterns, and flood hazards would be the same as Alternative 1.

Analysis of Direct and Indirect Impacts

Construction

Water Quality

Construction of the solar facility, gen-tie lines, new substations, access roads, and O&M buildings would require ground-disturbing activities, including clearing and grading for structure installation work areas, and access construction. Disturbed soils accelerate erosion and increase sediment in stormwater runoff to receiving waters, causing increased turbidity and sedimentation. Construction-related erosion and sedimentation as a result of soil disturbance would be minimized as part of Alternative 3 with preparation of a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) and SWPPP (BMP-2). Construction of Alternative 3 would not permanently alter the course of any of the drainages. Additionally, fuel, oil, and other fluids used in construction vehicles, equipment, and heavy machinery could enter drainages via storm flow and contaminate water, introducing additional sources of polluted stormwater runoff. The potential for accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, and other hazardous materials would be minimized as part of Alternative 3 with implementation of BMP-9, in addition to BMP-2.

Ground disturbance related to construction of Alternative 3 could potentially degrade water quality through the inadvertent release of residual pesticides from former agricultural uses. All pesticides used in the United States must be registered (licensed) by the EPA, which requires that pesticides would not cause unreasonable harm to the environment. Registered pesticides must be used in accordance with directions contained on the label of the product. Furthermore, similar to Alternative 1, Alternative 3 would not include the use of pesticides during construction or operation. While the Project may involve the use of herbicides as part of the Integrated Weed Management Plan (BMP-10), herbicides would be applied in accordance with all recommended or required application procedures.

Hazardous material storage and management would be implemented in accordance with requirements set forth by the RCFD, Riverside County Office of Emergency Services, DTSC, and CUPA for storage and handling of hazardous materials. As part of Alternative 3, the potential for accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, and other hazardous materials would be minimized with implementation of BMP-9. In addition, construction activities would occur according to OSHA regulatory

requirements; therefore, it is not anticipated that construction activities for Alternative 3 would release hazardous materials, substances, or waste.

Surface Water, Groundwater, and Water Supply

The Alternative 3 site contains the same ephemeral drainage that bisects Alternative 1, and which may would be affected by construction, operation, or maintenance of Alternative 3. The solar panels would be designed to avoid placement within the ephemeral drainage; however, similar to Alternative 1 at least one gen-tie pole would be within the potential ordinary high water mark of the drainage. Construction of the new substations, O&M buildings, and equipment pads would introduce new areas of impermeable surfaces that would potentially interfere with groundwater recharge within the groundwater basin. The two primary access roads to the O&M buildings would be improved for approximately 100 feet and would be 20 feet wide. The interior access roads within the solar facility site would 12 feet wide and unpaved and pervious. The new impermeable surface areas would not result in substantial negative effects on groundwater recharge. Construction of the interior unpaved access roads and use of heavy equipment and vehicles across the Alternative 3 area could result in soil compaction, which could increase surface water runoff rates and quantities, as well as decrease the rate at which water is able to percolate through the ground. As part of Alternative 3, soil compaction would be minimized through minimization of ground disturbance (BMP-13) and use of aggregate for new access roads (BMP-15).

Based on the 2010 PVID records, irrigation of the agricultural fields on the proposed solar facility site used approximately 12,000 AF per year of surface water. It is assumed that Alternative 3 construction would not involve the use of groundwater pumped from existing wells on-site. During the 36-month construction period for Alternative 3, the water supply that is presently used for agricultural irrigation would be reduced to a maximum of 345 AF/year (up to 1,354 AF of water for the three-year construction period). Construction water would be used for dust suppression, concrete manufacturing, and fire safety. Accordingly, there would be a beneficial impact to the water supply through reduced usage.

Existing Drainage Patterns

Alternative 3 facilities would be sited to provide adequate setbacks between solar facility components and ephemeral drainage (BMP-11). These setbacks would preserve and maintain the hydrological functions of the drainage to the extent possible. Construction of Alternative 3 would require ground-disturbing activities, including solar array installation, substation and O&M building construction, and construction of access roads. Grading could potentially alter naturally occurring drainage patterns and result in soil erosion, sedimentation, long-term siltation, and increased stormwater runoff, which increases the potential for flooding off-site or downstream of the construction areas. However, the Alternative 3 site is relatively flat and would not require mass grading for construction purposes. The majority of the original grades and natural drainage features at the Alternative 3 site would be maintained and, therefore, no added storm drainage control would be required outside of the substations and switching station. Blading and other methods of vegetation removal for clearance of roads and construction areas decrease the ability of the soil to absorb water, which also increases stormwater runoff from such disturbed areas. As part of Alternative 3, BMP-1 (Drainage, Erosion, and Sedimentation Control Plan) and BMP-2 (Stormwater Pollution Prevention Plan) would be implemented; this would minimize impacts from storm water runoff and existing drainage patterns. In addition, the minimization of ground and surface disturbance (BMP-13), limitation of vehicle travel and traffic (BMP-14), and construction of new access roads and parking lots (BMP-15) would minimize impacts to the existing drainage patterns.

Operation and Maintenance

Water Quality

The new substations and O&M buildings would create new areas of impermeable surfaces, which have the potential to increase the rate of stormwater runoff, leading to increased erosion and long-term siltation and flooding downstream of the new impermeable areas, and contribute additional sources of polluted runoff. As part of Alternative 3, however, BMP-1 and BMP-2 would be implemented, which would minimize impacts to water quality that would result from erosion and increased turbidity and

sedimentation downstream. Maintenance of access roads and structure pads (e.g., gravelling and vegetation clearance) would contribute additional sources of runoff. As part of Alternative 3, BMP-13 through BMP-15 would be implemented, which would also minimize potential impacts from runoff.

The O&M buildings would generate a minimum volume of wastewater as result of daily activities. Wastewater would be treated via a septic system permitted through the Riverside County Department of Environmental Health Services, and would be in compliance with Department requirements.

Groundwater and Water Supply

Alternative 3 would require a limited amount of water for washing of the solar panels, fire water supply, and supply for the operations and maintenance buildings. Up to 345 AF/yr of non-potable water would be required for Alternative 3 operation, which is well below the existing irrigation use of approximately 12,000 AF/yr. Water for Alternative 3 would be taken from existing PVID water entitlements that support the agricultural operations currently on the proposed solar facility site; current operations are not supported by groundwater wells. CSA #122 has issued a will-serve letter for BMSP's limited potable water needs. Less than 1.0 AF of groundwater per year would be required for potable use in the two O&M buildings.

The water supply from PVID sources and CSA #122 is sufficient to meet requirements of Alternative 3, including the minor potable groundwater demand under average-year, single-dry year, and multiple-dry year conditions over a 20-year future projection (refer to Appendix G, *Water Supply Assessment Report*).

Flood Hazards

Alternative 3 would be in an area designated by FEMA as Zone D, which is reserved for areas where there are possible but undetermined flood hazards, and where no flood hazard analysis has been conducted. However, Alternative 3 would be on the Palo Verde Mesa, which is on high ground, at an elevation approximately 50 feet above the historic floodplain of the Colorado River. Additionally, Alternative 3 would be approximately eight miles west of the current channel of the Colorado River, and it is unlikely that floodwaters associated with the Colorado River would affect Alternative 3.

The ephemeral drainage that bisects the southern portion of the proposed solar facility site was analyzed to determine the depth and extent of a 100-year flood hazard area associated with this drainage (see Appendix H *Blythe Mesa CUP 03685 Wash Feature Summary of Findings*). The extent of the floodplain for this area is delineated in Figure 3.2.9-1 *Floodplain Delineation*. The analysis determined a 100-year flood flow would have a flow velocity of 5,557 cubic feet per second and, given the wide, flat nature of the topography, flood depths would be shallow (3.71 feet maximum depth) and average stream velocities would vary from 6.8 feet per second (4.6 mph) to 2.4 feet per second (1.6 mph) outside of the main channel, and scour would be minimal. Based on the results of this analysis, solar panels, associated hardware, and substation foundations could be elevated to provide additional clearance above the calculated 100-year flood depth, and structured that could not be relocated (e.g., gen-tie line structures) would be designed to withstand potential flood hazards.

Alternative 3 would not involve work in the vicinity of a levee or dam, nor would Alternative 3 be located such that it would expose people or structures to significant risk of loss, injury, or death involving flooding.

Alternative 3 would not be in a location that could be affected by a tsunami or seiche. Alternative 3 would be in an area characterized by well-drained soils and low precipitation and would not be within a State of California Earthquake Fault Zone for known active faults, and no known or potentially active faults are mapped within the vicinity of the Alternative 3 area (the nearest active fault is approximately 58 miles away).

Decommissioning

Activities associated with decommissioning are similar to construction; therefore, effects related to hydrology and water quality associated with decommissioning would be similar to construction-related effects of Alternative 3.

Application of CEQA Significance Thresholds

HYD-1) Would Alternative 3 violate any water quality standards or waste discharge regulations?

Temporary, direct impacts to water quality could result from stormwater runoff during construction and operation of Alternative 3, resulting in erosion and increased turbidity and sedimentation downstream if not managed appropriately. In addition, stormwater runoff could transport fuel, oil, and other fluids into drainages via stormwater flow. As part of the Project, BMP-1, BMP-2, BMP-9, BMP-13, BMP-14, and BMP-15 would be implemented to minimize potential impacts to water quality from sedimentation, turbidity, and oil/chemical contamination. Implementation of Mitigation Measure Hydrology-1 would further reduce these potential impacts to a less than significant level.

HYD-2) Would Alternative 3 substantially deplete supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction and operation of the O&M buildings, substations, and equipment pads would create new areas of impermeable surfaces that could potentially interfere with groundwater recharge; however, the new impermeable surfaces would be minimal in comparison to the total solar facility area, which would be left in a pervious condition, and would not significantly interfere with groundwater recharge. Water supplies required for construction, operation, and maintenance of Alternative 3 would be provided by PVID water entitlements that currently support the agricultural operations on-site; these operations are not currently supported by groundwater wells. The Watershed Supply Assessment conducted for the Project determined that adequate water supplies would exist to serve the Project over the life of Alternative 3 (construction, operation, maintenance, and decommissioning). The great majority of water for Alternative 3 (i.e., all of the non-potable water) would not be delivered by a public water system or using public water system connections. Alternative 3 would use existing water infrastructure that currently delivers irrigation water from the PVID. Riverside County Community Service Area #122 (CSA #122) has substantiated its intention to provide this potable supply by issuing a will-serve letter (October 26, 2012 c/o Steve H. Jones – Manager) for the Project's limited potable water needs. CSA #122 has provided a will-serve letter for the small amount (up to 150 gallons per day) of potable water for the two O&M buildings. Alternative 3 would result in a beneficial increase in available PVID water supply due to the reduction in water demand on compared to existing agricultural use.

HYD-3) Would Alternative 3 substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

As described previously, an ephemeral drainage bisects the gen-tie line and the southern portion of the proposed solar facility site; however, Alternative 3 design would include buffers between Project facilities and natural washes, as described in BMP-11. Although on-site grading would be minimized, the installation of proposed facilities, including roads, fencing, solar arrays, and towers along the transmission corridor, could interfere with existing drainage patterns on-site. Any necessary grading would follow existing contours as feasible to minimize alteration of existing drainage patterns (BMP-11). Erosion and sedimentation would be minimized through implementation of the Project Drainage, Erosion, and Sedimentation Control Plan (BMP-1), as well as the required Project SWPPP (BMP-2), and other measures as described in Mitigation Measures Hydrology-1 through Hydrology-4. Implementation of the BMPs, as part of the Project, and mitigation measures would reduce these impacts to less than significant.

HYD-4) Would Alternative 3 substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

As described in HYD-2, the creation of impermeable surfaces relative to the area of Alternative 3 would be nominal. The Alternative 3 would result in slight alterations in the existing drainage pattern of the site or area (refer to discussion in HYD-3). Alternative 3 would be in an area characterized by well-drained soils and low precipitation, and any necessary grading would follow existing contours as feasible to minimize alteration to the existing drainage patterns as described in HYD-3. Designed setbacks, as described in BMP-11, would also minimize alterations to drainage patterns of the ephemeral wash and its associated floodplain, further reducing the potential for flooding on- or off-site. Therefore, there is low potential for flooding on- or off-site during construction, operation, maintenance, and decommissioning of Alternative 3. Impacts would be less than significant.

HYD-5) Would Alternative 3 create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Creation of new permanent access roads (both paved and unpaved) and construction of the substations, O&M buildings, and equipment pads, along with grading for installation of the solar array, would create additional sources of runoff. Likewise, grading for construction of the solar facility would potentially contribute additional sources of runoff. As part of BMPs discussed above, impacts related to the introduction of additional sources of polluted runoff would be minimized. The majority of the original grades and natural drainage features within the solar facility site and gen-tie line corridor would be maintained; within the substations and switching station, stormwater drainage would be designed to minimize erosion and sediment-laden runoff as well as control the flow of water leaving the property to minimize potential for erosion and flooding off-site, as described in mitigation measure Hydrology-4. Impacts would be less than significant.

HYD-6) Would Alternative 3 otherwise substantially degrade water quality?

Ground disturbance related to construction of Alternative 3 would potentially degrade water quality through the inadvertent release of hazardous materials, pesticides, and herbicides.

While Alternative 3 construction and operation could include use or application of hazardous materials or wastewater with potential to degrade water quality, compliance with all applicable regulations and permit requirements would reduce the potential impacts to a less than significant level.

HYD-7) Would Alternative 3 place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

Alternative 3 would not include the construction of any residential units, and would not introduce new housing to the area. No impact would occur.

HYD-8) Would Alternative 3 place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Alternative 3 would be on the Palo Verde Mesa, at an elevation approximately 50 feet above the historic floodplain of the Colorado River (i.e., Palo Verde Valley approximately eight miles west of the current channel of the Colorado River) and would be unlikely to impede or redirect flood flows associated with the Colorado River. The Project would relocate or elevate Project components to avoid placing structures within the 100-year flood hazard area associated with the ephemeral drainage; gen-tie line structures that could not be relocated would be designed to withstand flood flows to the extent possible to minimize potential of these structures to

impede or redirect flood flows. Implementation of Mitigation Measures Hydrology-5 and Hydrology-6 would reduce impacts during construction, operation, maintenance, and decommissioning to less than significant levels.

HYD-9) Would Alternative 3 expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Alternative 3 would not be located in the vicinity of a levee or dam. Portions of the Project would be located in a floodplain, such that it would expose people or structures to significant risk of loss, injury, or death involving flooding. However, with implementation of Mitigation Measures Hydrology-5 and Hydrology-6 would reduce impacts during construction, operation, maintenance, and decommissioning to less than significant levels.

HYD-10) Would Alternative 3 be at risk of inundation by seiche, tsunami, or mudflow?

Alternative 3 would not be sited in a location that could be affected by a tsunami or seiche. Alternative 3 would be sited in an area characterized by well-drained soils and low precipitation, which is not within a State of California Earthquake Fault Zone for known active faults, and no known or potentially active faults are mapped within the vicinity of the Project area. Alternative 3 would not be affected by or result in a mudflow; no impact would occur.

HYD-11) Would Alternative 3 include new or retrofitted Stormwater Treatment Control BMPs (e.g., water quality treatment basins, constructed treatment wetlands), the operation of which could result in significant environmental effects (i.e., increased vectors and/or odors)?

No storm water drainage system exists on the Alternative 3 site. Construction of Alternative 3 would include implementation of a SWPPP (BMP-2). The plan would specify measures that would minimize or avoid potential effects associated with storm water runoff. Operation and maintenance would not introduce new infrastructure or alter existing surface water and drainage patterns beyond what occurred during the construction period. Therefore, impacts would be less than significant.

HYD-12) Would Alternative 3 cause changes in absorption rates or the rate and amount of surface runoff?

See HYD-2 above. Alternative 3 would cause slight changes in the absorption rates and amount of surface water to on-site or off-site drainages. Implementation of Mitigation Measures Hydrology-3 and Hydrology-4 would reduce potential impacts resulting from runoff and absorption rates.

HYD-13) Would Alternative 3 cause changes in the amount of surface water in any water body?

See HYD-2 above. Alternative 3 would reduce the amount of water used on-site compared to existing agricultural use, which would not have an adverse effect on Colorado River water supplies or diversions.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Also similar to Alternatives 1 and 3, Alternative 4 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The only difference between Alternatives 1, 3, and 4 is the location of the proposed 230 kV gen-tie line that would extend from the solar facility to the Colorado River Substation. The gen-tie alignment for Alternative 4 would be shifted approximately 0.8 mile to the south, leaving the southwestern section of the solar facility and continuing to the Colorado River Substation. Alternative 4 would be slightly longer than the proposed 230 kV gen-tie alignment (9.5 miles versus 8.4 miles); approximately three miles of the Alternative 4 230 kV gen-tie line would not parallel existing transmission lines, and new access roads may be required for construction of Alternative 4. In addition to the ephemeral stream that runs through the solar facility, the gen-tie line for this Alternative would twice cross an ephemeral drainage that drains from Mule Mountain. Alternative 4 would potentially have greater ground disturbance and areas of soil compaction than Alternatives 1 and 3.

AR072377

Unless noted below, all direct and indirect impacts to groundwater, water supply, water quality, drainage patterns, and flood hazards would be the same as Alternative 1.

Analysis of Direct and Indirect Impacts

Construction

Water Quality

Construction of Alternative 4 has the potential to affect an ephemeral drainage that flows north/northeast from Mule Mountain. Construction of the Alternative 4 gen-tie line would require ground-disturbing activities, including clearing and grading for structure installation work areas, and construction access. Disturbed soils can be susceptible to erosion and increase sediment in stormwater runoff to receiving waters, causing increased turbidity and sedimentation. Construction-related erosion and sedimentation as a result of soil disturbance would be minimized as part of Alternative 4, with preparation of a Drainage, Erosion, and Sedimentation Control Plan (BMP-1) and SWPPP (BMP-2). Additionally, fuel, oil, and other fluids used in construction vehicles, equipment, and heavy machinery could enter drainages via storm flow and contaminate water, introducing additional sources of polluted stormwater runoff. Implementation of BMP-9, as part of Alternative 4, would minimize the potential for accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, and other hazardous materials.

Hazardous material storage and management would be implemented in accordance with requirements set forth by the RCFD, Riverside County Office of Emergency Services, DTSC, and CUPA for storage and handling of hazardous materials. Implementation of BMP-9 as part of Alternative 4 would minimize the potential for accidental release of motor oil, fuel, antifreeze, hydraulic fluid, grease, and other hazardous materials. In addition, construction activities would occur according to OSHA regulatory requirements; therefore, it is not anticipated that construction activities for Alternative 4 would release hazardous materials, substances, or waste.

Surface Water, Groundwater, and Water Supply

Construction of new access or spur roads for the Alternative 4 gen-tie line would potentially affect the ephemeral drainage that flows from Mule Mountain. These access roads would be sited to avoid natural drainages as feasible, would be unpaved and pervious, and would not result in substantial negative effects on groundwater recharge. Use of heavy equipment and vehicles on these access roads could result in soil compaction, which could increase surface water runoff rates and quantities, as well as increase the rate at which water is able to percolate through the ground. Minimization of ground disturbance (BMP-13) would minimize soil compaction.

Existing Drainage Patterns

Alternative 4 gen-tie lines and access roads would be sited to provide adequate setbacks from natural washes (BMP-11). These setbacks would preserve and maintain the hydrological functions of drainages. As described previously, construction of Alternative 4 would require ground-disturbing activities. Grading could potentially alter naturally-occurring drainage patterns and result in soil erosion, sedimentation, long-term siltation, and increased stormwater runoff, which increases the potential for flooding off-site or downstream of the construction areas. However, the Alternative 4 alignment is relatively flat and would not require significant grading for construction purposes. The majority of the original grades and natural drainage features along the Alternative 4 alignment would be maintained and, therefore, no added storm drainage control would be required outside of the substations and switching station. Blading and other methods of vegetation removal for clearance of roads and construction areas decrease the ability of the soil to absorb water, which also increases stormwater runoff from such disturbed areas. As part of Alternative 4, implementation of BMP-1 (Drainage, Erosion, and Sedimentation Control Plan) and BMP-2 (Stormwater Pollution Prevention Plan) would ensure minimization of impacts from storm water runoff and existing drainage patterns. In addition, the minimization of ground and surface disturbance (BMP-13), limitation of vehicle travel and traffic (BMP-14), and siting of new access roads (BMP-15) would minimize impacts to the existing drainage patterns.

Operation and Maintenance

Water Quality

Maintenance of access roads and structure pads (e.g., gravelling and vegetation clearance) would contribute additional sources of runoff that could result in erosion and increased turbidity and sedimentation downstream. As part of Alternative 4, BMP-13 through BMP-15 would be implemented, which would minimize potential impacts from runoff.

Decommissioning

Activities associated with decommissioning of Alternative 4 are similar to construction of Alternatives 1 and 3; therefore, effects related to hydrology and water quality associated with decommissioning of Alternative 4 would be similar to construction-related effects of the proposed Project.

Application of CEQA Significance Thresholds

With respect to Alternative 4, the application of CEQA significance thresholds applicable to construction, operation, maintenance, and decommissioning are as described below.

HYD-1) Would Alternative 4 violate any water quality standards or waste discharge regulations?

Temporary, direct impacts to water quality could result from stormwater runoff during construction and operation of Alternative 4, resulting in erosion and increased turbidity and sedimentation downstream if not managed appropriately. In addition, stormwater runoff could transport fuel, oil, and other fluids into drainages via stormwater flow. As part of Alternative 4, BMP-1, BMP-2, BMP-9, BMP-13, BMP-14, and BMP-15 would be implemented to minimize potential impacts to water quality from sedimentation, turbidity, and oil/chemical contamination. Implementation of Mitigation Measure Hydrology-1 would further reduce these potential impacts to a less than significant level.

HYD-2) Would Alternative 4 substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Construction and operation of Alternative 4 would create a new but small area of impermeable surfaces that could potentially interfere with groundwater recharge. Water supplies required for construction, operation, and maintenance of Alternative 4 would be provided by PVID water entitlements that currently support the agricultural operations on-site; these operations are not currently supported by groundwater wells. The Watershed Supply Assessment conducted for the Project determined that adequate water supplies exist to serve Alternative 4 over the life of the Project (construction, operation, maintenance, and decommissioning). The great majority of water for Alternative 4 (i.e., all of the non-potable water) would not be delivered by a public water system or using public water system connections. Alternative 4 would use existing water infrastructure that currently delivers irrigation water from the PVID. Riverside County Community Service Area #122 (CSA #122) has substantiated its intention to provide this potable supply by issuing a will-serve letter (October 26, 2012 c/o Steve H. Jones – Manager) for the Project's limited potable water needs. CSA #122 has provided a will-serve letter for the small amount (up to 150 gallons per day) of potable water for the two O&M buildings. Alternative 4 would result in a beneficial increase in available PVID water supply due to the reduction in water demand on-site.

HYD-3) Would Alternative 4 substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Alternative 4 would cross one ephemeral stream that could potentially be affected by the proposed gen-tie line alignment. However, BMP-11 would be implemented as part of the Project; therefore, the potential impacts to this drainage would be minimized by ensuring a setback between the drainage and access roads and construction areas. As such, no Project-related impact to this drainage would occur. Although on-site grading would be minimized, the installation of proposed facilities, including roads and towers along the Alternative 4 alignment, could interfere with existing drainage patterns on-site. Any necessary grading would follow existing contours as feasible to minimize alteration of existing drainage patterns (BMP-11). Erosion and sedimentation would be minimized through implementation of the Drainage, Erosion, and Sedimentation Control Plan (BMP-1), as well as the required SWPPP (BMP-2), and other measures as described in Mitigation Measures Hydrology-1 through Hydrology-4. Implementation of these BMPs and mitigation measures would reduce these impacts to less than significant.

HYD-4) Would Alternative 4 substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Construction of Alternative 4 would result in slight alterations in the existing drainage pattern of the site or area (refer to discussion in HYD-3). Alternative 4 would be in an area characterized by well-drained soils and low precipitation; furthermore, Alternative 4 would be on the Palo Verde Mesa, which is at a higher elevation than the Palo Verde Valley to the east. Although there is an ephemeral drainage that bisects the Project area, there are no existing perennial streams or rivers within the Project area. Therefore, there is a low potential for flooding on- or off-site during construction, operation, maintenance, and decommissioning of Alternative 4. Impacts would be less than significant.

HYD-5) Would Alternative 4 create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Creation of new permanent access roads (unpaved) would create additional sources of runoff. With implementation of the BMPs discussed above, impacts related to the introduction of additional sources of polluted runoff would be minimized. The majority of the original grades and natural drainage features along the Alternative 4 gen-tie line corridor would be maintained; therefore, no added storm drainage control would be required. Impacts would be less than significant.

HYD-6) Would Alternative 4 otherwise substantially degrade water quality?

While Alternative 4 construction and operation could include use or application of hazardous materials with potential to degrade water quality, compliance with all applicable regulations and permit requirements would reduce the potential impacts to a less than significant level.

HYD-7) Would Alternative 4 place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

Alternative 4 would not include the construction of any residential units, and would not introduce new housing to the area. No impact would occur.

HYD-8) Would Alternative 4 place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Alternative 4 would be on the Palo Verde Mesa, at an elevation approximately 50 feet above the historic floodplain of the Colorado River (i.e., Palo Verde Valley approximately eight miles west of the current channel of the Colorado River) and would be unlikely to impede or redirect flood flows associated with the Colorado River. Alternative 4 would relocate or elevate Project components to avoid placing structures within the 100-year flood hazard area associated with the ephemeral drainage described in Alternatives 1 and 3. Implementation of Mitigation Measures Hydrology-5 and Hydrology-6 would reduce impacts during construction, operation, maintenance, and decommissioning to less than significant levels.

HYD-9) Would Alternative 4 expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Alternative 4 would not be located in the vicinity of a levee or dam. Portions of the Project would be located in a floodplain, such that it would expose people or structures to significant risk of loss, injury, or death involving flooding. However, with implementation of Mitigation Measures Hydrology-5 and Hydrology-6 would reduce impacts during construction, operation, maintenance, and decommissioning to less than significant levels.

HYD-10) Would Alternative 4 be at risk of inundation by seiche, tsunami, or mudflow?

Alternative 4 would not be sited in a location that could be affected by a tsunami or seiche. Alternative 4 would be sited in an area characterized by well-drained soils and low precipitation, which is not within a State of California Earthquake Fault Zone for known active faults, and no known or potentially active faults are mapped within the vicinity of the Project area. Alternative 4 would not be affected by or result in a mudflow; no impact would occur.

HYD-11) Would Alternative 4 include new or retrofitted Stormwater Treatment Control BMPs (e.g., water quality treatment basins, constructed treatment wetlands), the operation of which could result in significant environmental effects (i.e., increased vectors and/or odors)?

No storm water drainage system exists on the Project area. Construction of Alternative 4 would include implementation of a SWPPP (BMP-2). The plan would specify measures that would minimize or avoid potential effects associated with storm water runoff. Operation and maintenance would not introduce new infrastructure or alter existing surface water and drainage patterns beyond what occurred during the construction period. Therefore, impacts would be less than significant.

HYD-12) Would Alternative 4 cause changes in absorption rates or the rate and amount of surface runoff?

See HYD-3 and HYD-4 above. Alternative 4 would cause slight changes in the absorption rates and amount of surface water to on-site or off-site drainages. Implementation of Mitigation Measures Hydrology-3 and Hydrology-4 would reduce potential impacts resulting from runoff and absorption rates.

HYD-13) Would Alternative 4 cause changes in the amount of surface water in any water body?

See HYD-2 above. Alternative 4 would reduce the amount of water used on-site compared to existing agricultural use, which would not have an adverse effect on Colorado River water supplies or diversions.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce

electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Alternative 5 would include approximately 2,403 acres for the solar field. Similar to the proposed Project, 73 acres would be utilized for the 230 kV gen-tie line. In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building and would have one access point (planned on Seeley Avenue). The Reduced Acreage Alternative would also no longer extend a 230 kV overhead gen-tie line from an on-site substation north of I-10, as this Alternative would not be developed on land north of I-10. Instead, this Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be located within the solar facility. Alternative 5 would avoid impacts that would result from the construction, operation, maintenance, and decommissioning of a solar development north of I-10; however, the land on which Alternative 1 is proposed would continue with existing uses and the existing agricultural use north of I-10 would continue to utilize a greater amount of water than with utilization of this same area for a solar facility, resulting in a lesser degree of beneficial impact for Alternative 5 than for Alternative 1. Nonetheless, the impact of Alternative 5 would be beneficial as water demand would be less post-project than the pre-project agricultural usage.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but not within the City limits of Blythe in comparison to the proposed Project. Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The construction, operation and decommissioning of Alternative 5 would not exceed the impacts to hydrology and water quality identified under the Alternative 1 analysis. Therefore, the Alternative 1 analysis would be applicable to Alternative 5, outside of those differences identified in the discussion below.

Analysis of Direct and Indirect Impacts

Construction

Water Quality

In comparison to the proposed Project, Alternative 5 would be on a reduced footprint of approximately 2,476 acres from 3,660 acres. Although reduced in total acreage in comparison to Alternative 1, construction of the Alternative 5 solar facility, gen-tie line, new substations, access road, and O&M building would require ground-disturbing activities, including clearing and grading for structure installation work areas, and access construction similar to Alternative 1. As such, the direct and indirect impact analysis under Alternative 1 would apply.

Surface Water, Groundwater, and Water Supply

As previously analyzed, the Alternative 1 Project area contains one ephemeral drainage that would be affected by construction, operation, or maintenance of the proposed Project. Alternative 5 falls within the same footprint as Alternative 1, with the exception of the development north of I-10. As such, the Alternative 1 analysis would apply for Alternative 5 assuming construction of the new substations, one O&M building, and equipment pad. The one primary access road (Seeley Avenue) to the O&M building would be improved for approximately 100 feet and would be 16 to 20 feet wide.

Similar to Alternative 1, it is assumed that Alternative 5 construction would not involve the use of groundwater pumped from existing wells on-site. During the 36-month construction period for Alternative 5, a fraction of the water demand that is presently needed for agricultural irrigation would be reduced even greater than under Alternative 1 development. Construction water would be used for dust suppression, concrete manufacturing, and fire safety. Accordingly, there would be a beneficial impact to the water supply.

Existing Drainage Patterns

Similar to development of Alternative 1, facilities under Alternative 5 would be sited to provide adequate setbacks between solar facility components (solar panels, gen-tie lines, substations, access roads, and O&M building) and natural washes (BMP-11). These setbacks would preserve and maintain the natural washes' hydrological functions. Construction of Alternative 5 would require less ground-disturbing activities compared to Alternative 1, due to no development north of I-10. However, grading could potentially alter naturally occurring drainage patterns and result in soil erosion, sedimentation, long-term siltation, and increased stormwater runoff, which increases the potential for flooding off-site or downstream of the construction areas. Refer to the Alternative 1 analysis for the development area south of I-10.

Operation and Maintenance

Water Quality

The analysis for Alternative 1 would apply for Alternative 5, with the exception of no development north of I-10 and one less substation and O&M building that would create new areas of impermeable surfaces to potentially increase the rate of stormwater runoff, leading to increased erosion and long-term siltation and flooding downstream of the new impermeable areas, and contribute additional sources of polluted runoff.

Groundwater and Water Supply

Similar to Alternative 1, development of Alternative 5 would require a limited amount of water for washing of the solar panels, fire water supply, and supply for the operations and maintenance building. In comparison, Alternative 5 would require a reduced amount of water due to fewer facilities and a smaller footprint. As these water needs would fall within those specific under Alternative 1, the water supply from PVID sources and CSA #122 would be sufficient to meet requirements of Alternative 5, including the minor potable groundwater demand under average-year, single-dry year, and multiple-dry year conditions over a 20-year future projection.

Flood Hazards

Similar to Alternative 1, Alternative 5 would be in an area designated by FEMA as Zone D, which is reserved for areas where there are possible but undetermined flood hazards, and where no flood hazard analysis has been conducted. Alternative 5 would contain the floodplain of the small ephemeral drainage for which flood hazards were analyzed (see Appendix H *Blythe Mesa CUP 03685 Wash Feature Summary of Findings*). The Alternative 1 analysis would apply.

Decommissioning

Activities associated with decommissioning are similar to construction; therefore, effects related to hydrology and water quality associated with decommissioning would be similar to construction-related effects of Alternative 5.

Application of CEQA Significance Thresholds

HYD-1) Would Alternative 5 violate any water quality standards or waste discharge regulations?

Temporary, direct impacts to water quality could result from stormwater runoff during construction and operation of Alternative 5, similar to Alternative 1. The HYD-1 Alternative 1 analysis would apply.

HYD-2) Would Alternative 5 substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table (e.g., the production rate of pre-existing nearby

wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Alternative 5 construction and operation of the one O&M building, substations, and equipment pads would create new areas of impermeable surfaces that could potentially interfere with groundwater recharge, similar to Alternative 1; however, the new impermeable surfaces would be nominal in comparison to the solar facility area and would not significantly interfere with groundwater recharge. The great majority of water for Alternative 5 (i.e., all of the non-potable water) would not be delivered by a public water system or using public water system connections. Alternative 5 would use existing water infrastructure that currently delivers irrigation water from the PVID. Riverside County Community Service Area #122 (CSA #122) has substantiated its intention to provide this potable supply by issuing a will-serve letter (October 26, 2012 c/o Steve H. Jones – Manager) for the Project's limited potable water needs. CSA #122 has provided a will-serve letter for the small amount (up to 150 gallons per day) of potable water for the two O&M buildings. The HYD-2 Alternative 1 analysis would apply.

HYD-3) Would Alternative 5 substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Alternative 5 would be developed within the limits of Alternative 1, under reduced acreage; as such, the HYD-3 analysis for Alternative 1 would apply.

HYD-4) Would Alternative 5 substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

As described in HYD-2, the creation of impermeable surfaces relative to the Alternative 5 area would be nominal. Alternative 5 would result in slight alterations in the existing drainage pattern of the site or area (refer to discussion in HYD-3). Alternative 5 would be in an area characterized by well-drained soils and low precipitation; furthermore, Alternative 5 would be on the Palo Verde Mesa, which is at a higher elevation than the Palo Verde Valley to the east. There is one ephemeral drainage, but no existing perennial streams or rivers are within the Alternative 5 area. Therefore, there is low potential for flooding on- or off-site during construction, operation, maintenance, and decommissioning of Alternative 5. Impacts would be less than significant.

HYD-5) Would Alternative 5 create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Although Alternative 5 would involve a reduced amount of development compared to Alternative 1, the HYD-1 analysis for Alternative 1 would apply to the Alternative 5 development portion south of I-10.

HYD-6) Would Alternative 5 otherwise substantially degrade water quality?

Similar to Alternative 1, ground disturbance related to construction of Alternative 5 would potentially degrade water quality through the inadvertent release of hazardous materials, pesticides, and herbicides. However, the development footprint of Alternative 5 would be reduced in comparison to Alternative 1. While Alternative 5 construction and operation could include use or application of hazardous materials or wastewater with potential to degrade water quality, compliance with all applicable regulations and permit requirements would reduce the potential impacts to a less than significant level.

HYD-7) Would Alternative 5 place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

Alternative 5 would not include the construction of any residential units, and would not introduce new housing to the area. No impact would occur.

HYD-8) Would Alternative 5 place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Similar to Alternative 1, it is unlikely that floodwaters would significantly affect Alternative 5, or that Project structures or components would impede or redirect flood flows, as Alternative 5 would be developed in the same area south of I-10. The HYD-8 analysis for Alternative 1 would apply. Implementation of Mitigation Measures Hydrology-5 and Hydrology-6 would reduce impacts during construction, operation, maintenance, and decommissioning to less than significant levels.

HYD-9) Would Alternative 5 expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Alternative 5 would not be located in the vicinity of a levee or dam. Portions of the Project would be located in a floodplain, such that it would expose people or structures to significant risk of loss, injury, or death involving flooding. However, with implementation of Mitigation Measures Hydrology-5 and Hydrology-6 would reduce impacts during construction, operation, maintenance, and decommissioning to less than significant levels.

HYD-10) Would Alternative 5 be at risk of inundation by seiche, tsunami, or mudflow?

Similar to Alternative 1, Alternative 5 would not be sited in a location that could be affected by a tsunami or seiche. Alternative 5 would be sited in an area characterized by well-drained soils and low precipitation, which is not within a State of California Earthquake Fault Zone for known active faults, and no known or potentially active faults are mapped within the vicinity of the Project area. Alternative 5 would not be affected by or result in a mudflow; no impact would occur.

HYD-11) Would Alternative 5 include new or retrofitted Stormwater Treatment Control BMPs (e.g., water quality treatment basins, constructed treatment wetlands), the operation of which could result in significant environmental effects (i.e., increased vectors and/or odors)?

The majority of the original grades and natural drainage features at the Alternative 5 site would be maintained and, therefore, no added storm drainage control would be required. The HYD-11 Alternative 1 analysis would apply.

HYD-12) Would Alternative 5 cause changes in absorption rates or the rate and amount of surface runoff?

See HYD-3 and HYD-4 above.

HYD-13) Would Alternative 5 cause changes in the amount of surface water in any water body?

See HYD-2 above.

Cumulative Impacts

Geographic Scope

Cumulative effects would result from incremental impacts of the proposed Project when added to other past, present, and reasonably foreseeable future actions within the designated region of influence. The term “cumulative effects” means those effects on water resources and water quality caused by other projects and activities unrelated to the proposed Project.

AR072385

The proposed Project would be within an undefined Hydrologic Sub-Area (HSA 715.40) of the Palo Verde Hydrologic Area. Since the BMSP has the potential to affect the entire hydrologic sub-area, rather than merely the immediate Project vicinity, this Hydrologic Sub-Area defines the impact area for this cumulative impact analysis.

Temporal Scope

The temporal scope refers to the duration over which an impact would occur, either short-term or long-term; for example, a short-term impact would occur only during the months of construction, and a long-term impact would occur during operation and maintenance, or during all phases. This limits the projects whose water resource impacts are included in the cumulative effects analysis to those that would cause impacts to water resources concurrently with the proposed Project. Determining the temporal scope of impacts requires an estimation of the temporality of the individual or cumulative effects. The temporal scope of cumulative impacts to water resources would be during the development of projects through the end of Project decommissioning, as any direct or indirect effects of the Project would occur only during the life of the Project.

Analysis of Direct and Indirect Impacts

Alternative 1: Proposed Project

Construction, Operation, Maintenance, and Decommissioning

Construction and operation of the proposed Project could potentially impact water quality of unnamed ephemeral streams downslope of the Project area as stormwater leaves the Project area as sheet flow. These impacts could occur as a result of ground-disturbing activities, including clearing and grading for structure installation work areas and access road construction. Disturbed soils accelerate erosion and increase delivery of sediment in stormwater runoff to receiving waters, causing increased turbidity and sedimentation. Additionally, fuel, oil, and other fluids used in construction vehicles, equipment, and heavy machinery could enter streams and contaminate water. Project-related ground disturbance could potentially alter drainage patterns within the work areas and result in soil erosion, leading to increased sedimentation or an increase in the rate or amount of surface water runoff. Grading activities could also potentially create additional sources of runoff, including polluted runoff. Many of the present and reasonably foreseeable projects involve grading activities, including those on a large-scale basis. These projects could also have potential to affect the impact area by altering drainage patterns, accelerating erosion, and adding additional sediment to local drainages. Compacted or new paved areas could potentially increase the rate or amount of stormwater runoff, or create additional sources of stormwater runoff. Polluted runoff could be introduced to the impact area as oil products, which collect on new paved or compacted surfaces and are washed into the system with stormwater runoff.

Impacts that are individually less than significant are cumulatively significant if they contribute incrementally to a cumulative impact that is already significant. For example, if a project results in sedimentation impacts that are less than significant on a project-level basis, the cumulative impact from sedimentation can be significant if the sediment is released into a stream that has not yet recovered from previous sedimentation impacts. However, potential impacts to water resources resulting from construction and operation of the proposed Project when combined with the cumulative effects on the Hydrologic Sub-Area would be less than significant with the implementation of the above-referenced BMPs, applicable local, State, and federal requirements, and mitigation measures. As previously explained, for the purposes of this Draft EIR/EA, BMPs are: 1) requirements of existing policies, practices, and measures required by law, regulation, or local policy; and 2) ongoing, regularly occurring practices. As such, the BMPs identified in this Draft EIR/EA are inherently part of the proposed Project and Alternatives. In addition, all of the cumulative scenario projects would be regulated under the same applicable local, State, and federal requirements, as discussed above. To ensure potential impacts are minimized, the projects under the cumulative scenario could also require additional mitigation, as required under the environmental review for each project. Adherence to these requirements and additional mitigation measures would ensure that impacts to water resources resulting from construction and

operation of the proposed Project when combined with the cumulative effects on the Hydrologic Sub-Area would be less than significant.

Therefore, during construction and operation of each of the projects under the cumulative scenario, the previously mentioned potential water quality pollutants would be regulated under applicable local, State, and federal requirements. Cumulative projects could require additional mitigation to minimize any potential impacts. Any remaining effects to water quality would be discreet in nature, associated with isolated incidents, and generally of low occurrence due to the nature of projects anticipated under the cumulative scenario. The projects listed under the cumulative scenario, which represent primarily renewable energy and other infrastructure projects, are not representative of major users of hazardous materials. Overall contributions to erosion and sedimentation within the Hydrologic Sub-Area would be minimized by mitigation measures that have been required of projects under the cumulative scenario and other applicable environmental regulations. These mitigation measures would minimize overall contributions to erosion and sedimentation within the watershed by establishing thresholds in the context of cumulative conditions through the inclusion of construction and operation period controls on stormwater management. These mitigation measures would also suffice in minimizing residual impacts that could occur for each project under the cumulative scenario by requiring avoidance and mitigation of components and actions that could cause erosion and sedimentation. The nature of the projects under the cumulative scenario would not involve extensive development of new impervious surfaces. Complying with proposed mitigation would also ensure that potential direct impacts to flood-related hazards would be avoided for the proposed Project and Alternatives. Individual projects under the cumulative scenario would utilize measures for drainage control and flood management and would implement mitigation measures to minimize potential harm to workers and on-site facilities.

Alternative 2: No Project Alternative

Under the No Project Alternative, the majority of the Project area would continue to be used for agricultural purposes. Public lands in the Project area would continue to be managed by the BLM in accordance with existing land use designations in the CDCA Plan and private lands would continue to be managed for agricultural production.

The No Project Alternative would eliminate the cumulative effects that would be contributed to the Hydrologic Sub-Area by construction, operation, maintenance, and decommissioning of the proposed Project or action Alternatives. The No Project Alternative would not prevent the present or reasonably foreseeable projects from being constructed, however, and those projects would continue to contribute cumulative impacts to the Hydrologic Sub-Area.

Alternative 3: Northern 230 kV Gen-tie Location

Construction, Operation, Maintenance, and Decommissioning

Alternative 3 is similar to Alternative 1 (the proposed Project), with the exception of the location of the gen-tie alignment, which would be approximately 700 feet north of the Alternative 1 gen-tie alignment. Cumulative effects to water resources associated with construction, operation, maintenance, and decommissioning of Alternative 3 would be the same as those of Alternative 1.

Alternative 4: Southern 230 kV Gen-tie Location

Construction, Operation, Maintenance, and Decommissioning

Alternative 4 is similar to Alternative 1 (proposed Project), with the exception of the location of the 230 kV gen-tie alignment. Although Alternative 4 would cross an ephemeral stream, the cumulative impacts associated with construction, operation, maintenance, and decommissioning of Alternative 4 would be the same as those of Alternative 1.

Alternative 5: Reduced Acreage Alternative

Construction, Operation, Maintenance, and Decommissioning

Potential impacts under Alternative 5 would be similar those described under Alternative 1, outside of the footprint reduction to development only occurring south of I-10. The potential impacts to water resources resulting from construction and operation of Alternative 5 when combined with the cumulative effects on the Hydrologic Sub-Area would be less than significant with the implementation of the above-referenced BMPs and applicable local, State, and federal requirements, and incorporation of mitigation measures. Refer to the cumulative analysis under Alternative 1.

Mitigation Measures

Where it was determined that a potential significant impact may occur, mitigation measures listed below would reduce potential impacts. Following application of BMPs and mitigation measures, potential impacts would be reduced to a level considered less than significant.

Hydrology-1 Existing drainage crossings shall be utilized at streams, washes, and irrigation channels to the extent feasible. New access roads not required for ongoing operation and maintenance shall be permanently closed after construction using the most effective and least environmentally damaging methods appropriate to that specific area, with concurrence of the land manager (e.g., stockpiling and replacing topsoil, rock replacement) in a manner that most closely matches undisturbed conditions of the area.

Hydrology-2 Roads would be built as near as possible to right angles to streams and washes, if feasible. Culverts would be installed where necessary and sized in accordance with local county regulations. All construction and maintenance activities shall be conducted in a manner that would minimize disturbance to vegetation and drainage channels, including ephemeral stream banks. In addition, road construction would include dust-control measures during construction especially in sensitive areas. All existing roads would be left in a condition equal to or better than their condition prior to the construction of the gen-tie line and other Project components.

Hydrology-3 New impervious areas associated with temporary construction would be restored to existing conditions, including but not limited to revegetation and decompaction, to the extent possible after completion of Project construction.

Hydrology-4 Stormwater drainage inside substations would be designed to minimize erosion and increase sediment control. Internal runoff would be released from the switching station by means of surface drainage structures designed to filter contaminants from water flow. Drainage from Project area, but not the gen-tie line, would be collected and controlled by surface improvements, as detailed in the SWPPP.

Hydrology-5 All new buildings (e.g., substation) shall be flood-proofed by constructing the finished floor a minimum of 24 inches above the highest adjacent ground or 100 year water surface elevation, whichever is greater. Slope protection may be required for buildings on fill. Additionally, the solar panels shall have a minimum clearance of 24 inches above the highest adjacent ground when upright to ensure flows are not obstructed.

Hydrology-6 No flow obstructing fences (chain link, block wall, etc.) shall be constructed along the north and west property lines, since these types of fences obstruct flows causing damage to adjacent properties. Fencing used in these areas shall contain openings of three inches high by six inches wide for first the 18 inches from the bottom, and openings of four inches high by six inches wide for the next eight inches and so forth. This fencing or equivalent shall be provided to allow the free flow of storm or flood runoff. No setback is

required with the use of this fencing. A detail of this fencing shall be provided to the County of Riverside.

Residual Impacts After Mitigation

With implementation of Project BMPs and mitigation measures, potential Project-specific and cumulative water quality and hydrology impacts would be less than significant.

NEPA Conclusions

The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged. The Project and the action Alternatives would result in the direct and indirect impacts and contribution toward cumulative impacts that are described above. Impacts would be reduced with implementation of Mitigation Measures Hydrology-1 through Hydrology-6. The Project and the action Alternatives would additionally comply with all federal, State, and local laws and regulations. Taking all these measures into account, the Project and the action Alternatives would not have a significant impact on hydrological resources.

AR072389

4.2.10 Land Use and Planning

This section describes the impact analysis relating to land use planning for the proposed Project and Alternatives. This section focuses on consistency with existing land use plans, ordinances, regulations, and policies. The Project's compatibility with existing or reasonably foreseeable land uses is also evaluated.

Methodology for Analysis

Evaluation of potential land use conflicts of the proposed Project and Alternatives was based on a review of relevant documents, including the Riverside County General Plan, Riverside County Zoning Ordinance, City of Blythe General Plan 2025, City of Blythe Zoning Code, the Federal Land Policy and Management Act (FLPMA), CDCA Plan, Land & Mineral Legacy Rehost 2000 System of automated records (LR2000), and a field review of the proposed solar facility site and surrounding area. The focus of the land use analysis is on land use conflicts that would result from implementation of the proposed Project and Alternatives. Land use conflicts are identified and evaluated based on existing or authorized land uses, land uses proposed as part of the Project, land use designations, and standards and policies related to land use. Land use compatibility is based on the intensity and patterns of land use to determine whether the Project would result in incompatible uses or nuisance issues. Potential land use conflicts or incompatibility (specifically during construction activities) are usually the result of other environmental effects, such as generation of noise or air quality issues resulting from grading activities. Land use conflicts that would result from the Project's construction, operation, maintenance, and decommissioning are evaluated in this section.

CEQA Significance Criteria

The criteria listed below were used to determine if the proposed Project would result in impacts to land use. These criteria were obtained from the CEQA Environmental Checklist, Appendix G of the 2012 CEQA Guidelines. Under CEQA, the proposed Project and Alternatives would have a significant impact on land use if they would:

LU-1) Physically divide an established community.

LU-2) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project (including but not limited to the general plan, specific plan, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.

LU-3) Conflict with any applicable habitat conservation plan or natural community conservation plan.

LU-4) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

LU-5) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

The following additional significance criteria from the County of Riverside CEQA Environmental Assessment form are used in the analysis. A project could have potentially significant impacts if it would:

LU-6) Result in a substantial alteration of the present or planned land use of an area.

LU-7) Affect land use within a city sphere of influence and/or within adjacent city or county boundaries.

LU-8) Be inconsistent with the site's existing or proposed zoning.

LU-9) Be incompatible with existing surrounding zoning.

LU-10) Disrupt or divide the physical arrangement of an established community (including a low-income or minority community).

NEPA Requirements

The term *significantly* as used in NEPA requires considerations of both context and intensity (40 CFR Part 1508.27). Therefore, thresholds serve as a benchmark for determining if a project action would result in a significant adverse environmental impact when evaluated against the baseline. The environmental effects analysis of the proposed Project on land uses includes an assessment of the context and intensity of the impacts as defined in the NEPA implementing regulations at 40 CFR Part 1508.27.

Applicable Best Management Practices

Land Use and Planning would not require the implementation of BMPs.

Alternative 1: Proposed Project

Analysis of Direct and Indirect Impacts

Existing Land Use, Planning and Zoning Designations

The solar facility would occupy 3,587 acres on privately-owned land under the jurisdiction of the County, approximately 334 acres of which are within the City of Blythe. The above-ground 230 kV gen-tie line would connect all three proposed on-site substations, extending a distance of approximately 3.6 miles within the solar facility. From the southernmost on-site substation to the Colorado River Substation, the gen-tie line would extend another 4.8 miles within a 125-foot-wide ROW, or 73 acres (traversing 3.8 miles [58 acres] of BLM-managed lands and one mile of private land [15 acres]).

The Project would be on lands under the jurisdiction of the County of Riverside, the BLM, and the City of Blythe. A majority of the Project would be within the County of Riverside and governed by the County of Riverside's General Plan and the Palo Verde Valley Area Plan. A portion of the solar array field would be in the City of Blythe General Plan. A portion of the 230 kV gen-tie line would traverse BLM-managed lands.

Figure 1-4 illustrates the portion of the gen-tie line that would traverse BLM-managed lands within the CDCA. These lands are designated Multiple-Use Class M (Moderate). Within the CDCA, the gen-tie line would be within BLM's Utility Corridor K, which is also designated as Section 368 Federal Energy Corridor 30-52 (BLM 2009). A majority of the Project would also be within BLM's Utility Corridor J. The gen-tie line would also be within the SEZ.

Federal

Lands traversed by the proposed Project and Alternatives under the jurisdiction of the BLM would be subject to the following plans and policies.

Federal Land Policy and Management Act of 1976

Construction of the proposed gen-tie line would be consistent with the FLPMA (43 U.S.C. § 1701 et seq.), which encourages the utilization of rights-of-way in common to the extent practical and the designation of right-of-way corridors (§ 1763). The gen-tie line and access roads proposed under the Project would be consistent with this provision, because the proposed gen-tie line would be within a designated utility corridor. The solar facility would be on privately owned land and not subject to the FLPMA.

California Desert Conservation Area (CDCA) Plan, 1980 as Amended

The CDCA Plan is a comprehensive, long-range plan covering 25 million acres. Approximately 12 million acres of this total are public lands administered by the BLM on behalf of the CDCA Plan, including the portion of the proposed gen-tie line on federal lands. The proposed gen-tie line is included in the "Land Use Activities" category of Transmission Lines as identified in Table 1, Multiple-Use Class Guidelines, of

the CDCA Plan. As noted in Table 1, under Multiple-Use Classes L, M, and I, "New…electric transmission facilities…may be allowed only within designated corridors" (BLM 1980). The gen-tie line would be within Multiple-Use Class M. As explained below, because the Western Solar Plan amended the CDCA Plan to identify this area as associated with power generation or transmission, the gen-tie line would be consistent with the CDCA Plan.

Northern and Eastern Colorado Desert (NECO) Coordinated Management Plan

The NECO Plan primarily addresses recovery of the desert tortoise and conservation of a variety of other species, modifies management of wild burro herds in the planning area, and updates policies regarding off-highway vehicle use and public lands access and use. The gen-tie line would be constructed primarily within Utility Corridor K. Construction activities would comply with the NECO Plan. Please refer to Section 4.2.4, *Biological Resources*, and Section 4.3.13, *Recreation*, for discussion regarding impacts to the NECO Plan.

Approved Resource Management Plan Amendments/Record of Decision for Solar Energy Development in Six Southwestern States (Western Solar Plan) (BLM 2012)

The Western Solar Plan's purpose was "to implement a comprehensive Solar Energy Program to administer development of utility-scale solar energy resources on BLM-administered lands in the six states," including California. The Western Solar Plan identified exclusion areas for utility-scale solar energy ROWs, priority areas for utility-scale energy development ROWs (i.e. SEZs), and areas potentially available for utility-scale solar energy outside of exclusion areas and SEZs (i.e., variance areas) (page 3). The Western Solar Plan amended the CDCA Plan to "identify all SEZ lands within the CDCA as sites associated with power generation or transmission" (Appendix A, Land Use Plan Amendments, page 36). The gen-tie line would be constructed within the SEZ, and therefore is consistent with the Western Solar Plan and the CDCA Plan, as amended.

Local

Lands that would be traversed by the proposed Project and Alternatives would be subject to the following local plans and policies.

Riverside County General Plan

The solar facility portion and a portion of the gen-tie line would be on private lands within an unincorporated area of Riverside County and would be subject to the goals and policies of the RCGP. The proposed Project would within the "Agriculture" and "Rural Community: Estate Density Residential" land use designations and the Project would be consistent with these land use designations.

Riverside County Zoning Ordinance

The proposed Project would be a conditionally permitted use under the W-2-10, W-2-5, and A-1-10 zones. It would be authorized pursuant to the approval of a CUP by the Riverside County Board of Supervisors and in compliance with Riverside County Board of Supervisor's Policy B-29. Pending this approval, no conflicts with the Riverside County Zoning Ordinance would occur. Therefore, impacts would be considered less than significant.

City of Blythe General Plan 2025

The solar facility portion of the proposed Project would be in the City of Blythe and would be subject to the goals and policies of the City of Blythe General Plan 2025. The proposed Project would be a permitted use within the "Agriculture" and "Service Industrial" land use designations with approval of a CUP and completion of an environmental review. Approximately 334 acres of the 3,597 acre solar facility component are located within the City of Blythe. A majority of the Project would be within the County of Riverside and within the PVVAP. A portion of the solar facility would be in the City of Blythe General Plan.

As described in Chapter 1, the County is the "lead agency" responsible for preparation of the EIR in compliance with CEQA. As the CEQA lead agency, the County is responsible for conducting the CEQA review and has final approval of the Project. The County is responsible for coordinating with the Applicant, public and associated agencies during the CEQA process. When more than one agency is involved in a project, the agency with primary responsibility for approving a project is the lead agency, for purposes of following the CEQA protocol. Other agencies with discretionary approval power over the project are called "responsible agencies." The City of Blythe is a responsible agency that has actively participated in the NEPA/CEQA process and review of the Draft EIR/EA.

City of Blythe Zoning Code

The proposed Project would be a conditionally permitted use under the Agriculture and Service Industrial zones. No conflicts with the City of Blythe Zoning code would occur. Therefore, impacts would be considered less than significant.

Riverside County Airport Land Use Compatibility Plan (RCALUCP) and Federal Aviation Administration

In April 2012, the Riverside County ALUC found the Project to be consistent with the RCALUCP. In addition, the FAA provided "No Hazard to Air Navigation" determinations for the 230 kV gen-tie line structures. Refer to Section 4.2.8, *Hazards and Hazardous Waste*, for a more detailed discussion regarding impacts to the RCALUCP.

Compatibility with Local Plans and Policies

The Project is generally consistent with policies and goals set forth in the RCGP, PVVAP, and City of Blythe General Plan 2025. The Project would be consistent with the Riverside County Zoning Ordinance (Ordinance 348) and City of Blythe Zoning Code. The Project's conformity with these local policies and goals is summarized in Table 4.2.10-1 below.

Construction, Operation, and Maintenance

The discussion above regarding compatibility with applicable land use plans and policies applies to construction, operation, and maintenance of the proposed Project and Alternatives. Following construction, the gen-tie line would be accessed using only roadways that are necessary to maintain it. The gen-tie line would be operated and maintained primarily within Corridor K, and fully within the Riverside East SEZ. Maintenance activities would be confined to existing roadways and disturbed areas. Therefore, operation and maintenance of the proposed Project would be consistent with the CDCA Plan and NECO Plan.

Table 4.2.10-1 Consistency with Regional/Local Land Use Plans, Policies, and Regulations

POLICY/REGULATIONS/GOALS	DESCRIPTION	CONFLICT ANALYSIS
Riverside County General Plan 2008		
Land Use Element Policy LU 1.8	Requires submittal of certain proposed actions to the Riverside County Airport Land Use Commission for review. Such actions include proposed amendments to the general plan, area plans, or specific plans, as well as proposed revisions to the zoning ordinance and building codes.	NO: The Riverside County Airport Land Use Commission found the Project consistent with the Riverside County Airport Land Use Compatibility Plan. (See Section 4.2.8 Hazards and Hazardous Materials).
Land Use Element Policy LU 2.1.c	Requires a broad range of land uses, including a range of residential, commercial, business, industry, open space, recreation and public facility uses (General Plan pg. LU-20).	

POLICY/REGULATIONS/GOALS	DESCRIPTION	CONFLICT ANALYSIS
Land Use Element Policy LU 5.1	Requires development does not exceed the ability to adequately provide supporting infrastructure and services (General Plan LU-24).	NO: The Project would no create a permanent increase in population; therefore, existing infrastructure and services would be adequate.
Land Use Element Policy LU 6.1	Require land uses to develop in accordance with the Riverside County General Plan (RCGP) and area plans to ensure compatibility and minimize impacts.	NO: With the approval of a CUP, the Project would be compatible with the RCGP and the PVVAP.
Land Use Element Policy LU 6.2	Public facilities shall also be allowed in any other land use designation except for the Open Space-Conservation and Open Space-Conservation Habitat land use designations. For purposes of this policy, a public facility shall include all facilities operated by the federal government, the State of California, the County of Riverside, any special district governed by the County of Riverside or any city, and all facilities operated by any combination of these agencies.	NO: The solar facility and gen-tie line would not preclude construction of public facilities in unoccupied areas of the solar facility site.
Land Use Element Policy LU 7.1	Accommodate the development of a balance of land uses that maintain and enhance the County's fiscal viability, economic diversity and environmental integrity (General Plan LU-26).	NO: The Project would allow the generation of renewable energy. Additionally, it would increase revenue for the County of Riverside.
Land Use Element Policy LU 8.1	Provide for the permanent preservation of open space lands that contain important natural resources and scenic and recreational values (General Plan LU-28).	NO: The Project is not located in an area with natural resources or scenic and recreational values.
Land Use Element Policy LU 8.2	Require that development protect environmental resources by compliance with the Multipurpose Open Space Element of the RCGP and federal and state regulations such as CEQA, NEPA, the Clean Air Act, and the Clean Water Act.	NO: The Project would comply with NEPA and CEQA and all necessary compliance measures.
Land Use Element Policy LU 9.1	Require that new development contribute their fair share to fund infrastructure and public facilities such as police and fire facilities.	NO: The Project is not anticipated to cause additional impacts to public facilities. See Section 4.2.13, Socioeconomics, for further analysis.
Land Use Element Policy LU 13.1	Preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public (General Plan LU-31).	No: The Project would be located on disturbed lands that are adjacent to existing electrical facilities.
Land Use Element Policy LU 13.5	Require new or relocated electric or communication distribution lines, which would be visible from Designated and Eligible State and County Scenic Highways, to be placed underground.	YES: The Project proposes the use of above ground distribution lines within view of an Eligible Scenic Highway; however, they would be parallel to existing transmission and distribution lines.
Land Use Element Policy LU 15.15	Permit and encourage, in an environmentally and fiscally responsible manner, the development of renewable energy resources and related infrastructure, including but not limited to, the development of solar power plants in the County of Riverside (General Plan LU-37).	NO: The Project would provide 485 MW of renewable solar energy.

POLICY/REGULATIONS/GOALS	DESCRIPTION	CONFLICT ANALYSIS
Multi-Purpose Open Space Element Policy OS 11.3	Permit and encourage the use of passive solar devices and other state-of-the-art energy resources.	NO: The Project would provide renewable solar energy.
Land Use Element Policy LU 14.7	Ensures that no structures or activities encroach upon or adversely affect the use of navigable airspace.	NO: The Project has obtained Federal Aviation Administration and ALUC review and approval.
Land Use Element Policy LU 16.4	Encourages conservation of productive agricultural lands. Preserve prime agricultural lands for high-value crop production.	NO: The Project would impact Farmlands, but would not substantially interfere with the County's plans and goals to encourage conservation of Farmland county-wide.
Palo Verde Valley Area Plan 2008		
Agricultural Preservation Policy Palo Verde Valley Area Plan (PVVAP) 4.1	Protects farmland and agricultural resources in the Palo Verde Valley through adherence to the Agriculture sections of the RCGP Multipurpose Open Space and Land Use Elements.	NO: The Project would impact Farmland and agricultural resources in the Palo Verde Valley (as defined by the PVVAP); however, a mitigation measure was developed to Palo Verde Valley area.
Recreational Vehicle Development Policy PVVAP 5.4	Allows remote recreational vehicle developments within the following land use designations: Very Low Density Residential, Estate Density Residential, Rural Residential, Rural Mountainous, Rural Desert, Open Space-Recreation, and Open Space-Rural.	NO: The Project would not close open recreational vehicle routes of travel nor would the Project preclude recreational vehicle developments in these land use designations
Trials and Bikeway System Policy PVVAP 9.1	Develops a system of multi-purpose trails that enhances the Colorado River's recreational values and connects with the adopted trails system of Riverside County.	NO: The Project would not close or remove trails, nor would it impact trails near the Colorado River.
Scenic Highways Policy PVVAP 10.1	Protects the scenic highways in the Palo Verde Valley planning area from change that would diminish the aesthetic value of adjacent properties in accordance with the Scenic Corridors sections of the RCGP Land Use, Multipurpose Open Space, and Circulation Elements.	NO: The Project may have views from County eligible scenic highways 95 and I-10, but the Project and Alternatives would be within an area with existing electrical facilities.
Scenic Highways Policy PVVAP 10.2	Encourages the designation of I-10 and U.S. Highway 95 as eligible and subsequently Official Scenic Highways in accordance with the California State Scenic Highway Program.	NO. The Project may have views from County eligible scenic highways 95 and I-10; however, the Project would not significantly impact these views (refer to Section 4.2.1, Aesthetics).
Riverside County Zoning Ordinance (Ordinance 348)		
Section 15.1.d. (32) Uses Permitted in W-2 Zone (Controlled Development Areas)	This zone permits a solar power plant on lot 10 acres or larger upon issuance of a CUP.	NO: With approval of a CUP, the Project would be an allowable use under this zone.
Section 13.1.c. (12) Uses Permitted in A-1 Zone (Light Agriculture)	This zone permits a solar power plant on a lot 10 acres or larger. upon issuance of a CUP.	NO: With approval of a CUP, the Project would be an allowable use under this zone.
City of Blythe General Plan 2025/City of Blythe Zoning Code		
Open Space Guiding Policy 1	Maintain hillsides and viable agricultural lands as open space for resource conservation and preservation of views.	NO: The Project would impact viable agricultural lands on the Palo Verde Mesa, but would not interfere substantially with the City's goal of preserving hillside and viable agricultural lands city-wide.

POLICY/REGULATIONS/GOALS	DESCRIPTION	CONFLICT ANALYSIS
Open Space Guiding Policy 9	Promote continued agricultural use of important farmland outside the urban area.	NO: The Project would impact Important Farmland on the Palo Verde Mesa. While the City, if it approved this Project, would be favoring environmentally friendly power generation over retention of on-site agricultural uses, approval of the Project would not preclude the City from continuing to support agricultural uses city-wide.
Agriculture (A)	This zone permits, upon issuance of a CUP, "utility operations facilities."	NO: With approval of a CUP, the Project would be an allowable use under this zone.
Service Industrial (I-S)	This zone permits "utility operations facilities."	NO: The Project would be an allowable use under this zone.

Sources: Riverside County General Plan 2003; Palo Verde Valley Area Plan 2008; Riverside County Zoning Ordinance (Ordinance 348); City of Blythe General Plan 2025/Blythe Zoning Code.

Decommissioning

At the end of the proposed Project's operational life, all equipment and components would be decommissioned and deconstructed. Structures used to support above-ground wires would be removed. A ROW grant from the BLM and CUPs from Riverside County and the City of Blythe would no longer be required.

Application of CEQA Significance Thresholds

LU-1) Would the Project physically divide an established community?

The proposed Project would not physically divide an established community. The Project area would be east and south of an existing community (Nicholls Warm Springs/Mesa Verde). The gen-tie line, access roads, and 34.5 kV distribution line would not be located through an established community. No impacts would occur.

LU-2) Would the Project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project (including but not limited to the general plan, specific plan, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

The Project would be subject to the RCGP, PVVAP, City of Blythe General Plan 2025, CDCA Plan, and NECO Plan. As summarized in Table 4.2.10-1, *Conflicts with Regional/Local Land Use Plans, Policies, and Regulations*, the Project would not conflict with applicable local land use plans, policies, or regulations (with the exception of Land Use Element Policy LU 13). The Project would be consistent with goals and policies related to agriculture (Riverside County Land Use Element Policy LU 16.4; PVVAP Agricultural Preservation Policy 4.1; and City of Blythe's Open Space Guiding Policies 1 and 9). With approval of a CUP and Public Use Permit (PUP), the Project would be a permitted use on private land. The gen-tie line structures proposed on BLM land would be within or adjacent to Utility Corridor K, and fully within the Riverside East SEZ and therefore consistent with the CDCA Plan and NECO Plan. Impacts to existing plans, policies, and regulations would be considered less than significant.

LU-3) Would the Project conflict with any applicable habitat conservation plan or natural community conservation plan?

As discussed in Section 4.2.4, *Biological Resources*, the Project would not be within the jurisdiction of any adopted habitat conservation plan or natural community conservation plan; therefore, no impacts would occur.

LU-4) Would the Project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Increases in demand for recreational facilities are typically associated with substantial increases in population or employment. As described in Section 4.2.13, the proposed Project would not contain a residential component that would result in long-term increased use of existing recreational facilities. During the three-year construction period, construction workers and their families may temporarily increase the use of recreational facilities; however, the Project is not expected to draw a substantial number of new employees to the area over the long term. Therefore, implementation of the proposed Project is not expected to result in any substantial physical deterioration of existing facilities. Impacts would be less than significant.

LU-5) Would the Project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

The Project would not include any plans for the addition of any recreational facilities, nor would it require the construction or expansion of recreational facilities. Therefore, the proposed Project would not result in any adverse physical effects on the environment from construction or expansion of additional recreational facilities; a less than significant impact would occur.

LU-6) Would the Project result in a substantial alteration of the present or planned land use of an area?

The Project would be on private lands that would be conditionally consistent (with approval of the CUP) with the RCGP and the PVVAP, as well as the City of Blythe General Plan 2025. The gen-tie line within BLM-managed lands would be consistent with the CDCA Plan and NECO Plan, because it would be within the Riverside East SEZ. Therefore, the Project would be consistent with present or planned land use of the area; impacts would be less than significant.

LU-7) Would the Project affect land use within a city sphere of influence and/or within adjacent city or county boundaries?

A portion of the Project's solar facility site would be within the City of Blythe Sphere of Influence; the gen-tie line that would extend outside of the solar facility would not. As discussed above, the Project would be conditionally consistent with the City of Blythe General Plan, RCGP, and PVVAP. Therefore, no impacts would occur to the City's sphere of influence.

LU-8) Would the Project be inconsistent with the site's existing or proposed zoning?

As described in LU-6 above, the solar facility for the Project would be conditionally consistent with existing zoning for the RCGP pursuant to the approval of a CUP and PUP, and compliance with Board of Supervisors Policy B-29, PVVAP, and City of Blythe General Plan. The gen-tie line would be consistent with the CDCA Plan and NECO Plan. The Project would not require a zone change or general plan amendment; therefore, the Project would be consistent with the site's existing zoning. No impacts would occur.

LU-9) Would the Project be incompatible with existing surrounding zoning?

The zoning surrounding the Project is similar to that of the Project area; therefore, the Project would be compatible with existing surrounding zoning; less than significant impact.

AR072397

LU-10) Would the Project disrupt or divide the physical arrangement of an established community (including a low-income or minority community)?

The Project would not be located through an established community (see LU-1). No impacts would occur.

Alternative 2: No Project Alternative

Under the No Project Alternative, the BLM would not grant a ROW, and Riverside County and the City of Blythe would not approve a CUP, PUP, and a Development Agreement for the proposed Project. As a result, no solar energy project would be constructed on county and city lands, and the solar facility would remain in agricultural production. No structures to support a gen-tie line in association with the proposed Project would occur on BLM-managed land. Under the No Project Alternative, the proposed Project would not be constructed and no operations, maintenance, or decommissioning activities would occur. Agricultural operations would continue on the solar facility, and no impacts to land use would occur.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 is similar to Alternative 1 (proposed Project), with the exception of the location of the Northern 230 kV gen-tie line, which is approximately 700 feet north of Alternative 1's proposed 230 kV gen-tie line. The solar facility would be within private lands under the jurisdiction of the County of Riverside and City of Blythe. The 230 kV gen-tie line that extends outside of the solar facility would be within or adjacent to the same utility corridor as Alternative 1 and within the same SEZ, but within BLM-managed lands only (no private lands). The direct and indirect impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be essentially the same as Alternative 1.

Application of CEQA Significance Thresholds

LU-1) Would Alternative 3 physically divide an established community?

Alternative 3 would not be located through an established community. Therefore, no impacts would occur.

LU-2) Would Alternative 3 conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over Alternative 3 (including but not limited to the general plan, specific plan, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Alternative 3 would not conflict with applicable land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. No impacts would occur.

LU-3) Would Alternative 3 conflict with any applicable habitat conservation plan or natural community conservation plan?

Alternative 3 would not be within the jurisdiction of any adopted habitat conservation plan or natural community conservation plan; therefore, no impacts would occur.

LU-4) Would Alternative 3 increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Alternative 3 would not contain a residential component that would result in an increased use of existing recreational facilities, and would not bring a substantial number of new employees to the area over the long term. Therefore, implementation of Alternative 3 is not expected to result in any substantial physical deterioration of existing facilities. Impacts would be less than significant.

LU-5) Would Alternative 3 include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Alternative 3 would not include any plans for the addition of any recreational facilities, nor would it require the construction or expansion of recreational facilities. Therefore, Alternative 3 would not result in any adverse physical effects on the environment from construction or expansion of additional recreational facilities; a less than significant impact would occur.

LU-6) Would Alternative 3 result in a substantial alteration of the present or planned land use of an area?

Similar to Alternative 1, portions of Alternative 3 within private lands would be conditionally consistent (with approval of the CUP) with the RCGP, PVVAP, and City of Blythe General Plan 2025. The gen-tie line within BLM-managed lands would be consistent with the CDCA Plan and NECO Plan, because it would be within the Riverside East SEZ. Therefore, Alternative 3 would be consistent with present or planned land use of the area.

LU-7) Would Alternative 3 affect land use within a city sphere of influence and/or within adjacent city or county boundaries?

A portion of Alternative 3's solar facility site would be within the City of Blythe Sphere of Influence; the gen-tie line that extends outside of the solar facility would not. Alternative 3 would be conditionally consistent with the City of Blythe General Plan, RCGP, and PVVAP. Therefore; no impacts would occur to the City's sphere of influence.

LU-8) Would Alternative 3 be inconsistent with the site's existing or proposed zoning?

As described in LU-6 above, the solar facility would be conditionally consistent with existing zoning for the RCGP, PVVAP, and City of Blythe General Plan. The gen-tie line would be consistent with the CDCA Plan and NECO Plan. Alternative 3 would not require a zone change or general plan amendment; therefore, it would be consistent with the site's existing zoning. No impacts would occur.

LU-9) Would Alternative 3 be incompatible with existing surrounding zoning?

Alternative 3 would have the same existing surrounding zoning as Alternative 1; therefore, Alternative 3 would be compatible with existing surrounding zoning. No impacts would occur.

LU-10) Would Alternative 3 disrupt or divide the physical arrangement of an established community (including a low-income or minority community)?

Alternative 3 would not be located through an established community (see LU-1 above). No impacts would occur.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Alternative 4 would be similar to Alternative 1, as the solar facility would be within private lands under the jurisdiction of the County of Riverside and City of Blythe; however, Alternative 4's 230 kV gen-tie line that extends outside of the solar facility would be several hundred feet south of the proposed alignment. Approximately three miles of Alternative 4's gen-tie line would not parallel existing transmission lines and would require construction of new access roads.

Application of CEQA Significance Thresholds

LU-1) Would Alternative 4 physically divide an established community?

Alternative 4 would not be located through an established community. Therefore, no impacts would occur.

LU-2) Would Alternative 4 conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over Alternative 4 (including but not limited to the general plan, specific plan, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect ?

Alternative 4 would not conflict with applicable land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. No impacts would occur.

LU-3) Would Alternative 4 conflict with any applicable habitat conservation plan or natural community conservation plan?

Alternative 4 would not be within the jurisdiction of any adopted habitat conservation plan or natural community conservation plan; therefore, no impacts would occur.

LU-4) Would Alternative 4 increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Increases in demand for recreational facilities are typically associated with substantial increases in population or employment. Alternative 4 would not contain a residential component that would result in an increased use of existing recreational facilities, and would not bring a substantial number of employees to the area over the long term. Therefore, implementation of Alternative 4 is not expected to result in any substantial physical deterioration of existing facilities. Impacts would be less than significant.

LU-5) Would Alternative 4 include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Alternative 4 would not include any plans for the addition of any recreational facilities, nor would it require the construction or expansion of recreational facilities. Therefore, Alternative 4 would not result in any adverse physical effects on the environment from construction or expansion of additional recreational facilities; a less than significant impact would occur.

LU-6) Would Alternative 4 result in a substantial alteration of the present or planned land use of an area?

Similar to Alternatives 1 and 3, portions of Alternative 4 within private lands would be conditionally consistent (with approval of the CUP) with the RCGP, PVVAP, and City of Blythe General Plan 2025. The gen-tie line within BLM-managed lands would be consistent with the CDCA Plan and NECO Plan, because it would be within the Riverside East SEZ. Therefore, Alternative 4 would be consistent with present or planned land use of the area.

LU-7) Would Alternative 4 affect land use within a city sphere of influence and/or within adjacent city or county boundaries?

A portion of Alternative 4's solar facility site would be within the City of Blythe Sphere of Influence; the gen-tie line that would extend outside of the solar facility would not. Alternative 4 would be conditionally consistent with the City of Blythe General Plan, RCGP, and PVVAP. Therefore; no impacts would occur to the City's sphere of influence.

LU-8) Would Alternative 4 be inconsistent with the site's existing or proposed zoning?

As described in LU-6 above, the solar facility would be conditionally consistent (with approval of the CUP) with existing zoning for the RCGP, PVVAP, and City of Blythe General Plan. The gen-tie line would be consistent with the CDCA Plan and NECO Plan. Alternative 4 would not require a zone change or general plan amendment; therefore, it would be consistent with the site's existing zoning. No impacts would occur.

LU-9) Would Alternative 4 be incompatible with existing surrounding zoning?

Alternative 4 would have the same existing surrounding zoning as Alternatives 1 and 3; therefore, Alternative 4 would be compatible with existing surrounding zoning. No impacts would occur.

LU-10) Would Alternative 4 disrupt or divide the physical arrangement of an established community (including a low-income or minority community)?

Alternative 4 would not be located through an established community (see LU-1 above). No impacts would occur.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Alternative 5 would include approximately 2,403 acres for the solar field. Similar to the proposed Project, 73 acres would be utilized for the 230 kV gen-tie line. In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building and would have one access point (planned on Seeley Avenue). The Reduced Acreage Alternative would also no longer extend a 230 kV overhead gen-tie line from an on-site substation north of I-10, as this Alternative would not be developed on land north of I-10. Instead, this Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility. Alternative 5 would avoid impacts that would result from the construction, operation, maintenance, and decommissioning of a solar development north of I-10; however, the land on which Alternative 1 is proposed would continue with existing uses. Under Alternative 5, the City of Blythe would not approve a CUP, PUP, and a Development Agreement for Alternative 5. As a result, no solar energy project would be constructed within the City's limits, and the site would remain in agricultural uses north of I-10. Under Alternative 5, no impacts to land use would occur in the area north of I-10.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but only within the Sphere of Influence of the City of Blythe in comparison to the proposed Project; therefore, Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The construction, operation, maintenance, and decommissioning of Alternative 5 would not exceed those land use impacts identified under the Alternative 1 analysis. Therefore, the Alternative 1 analysis would be applicable to Alternative 5, outside of those differences identified in the discussion below.

Analysis of Direct and Indirect Impacts

Existing Land Use, Planning and Zoning Designations

The Alternative 5 solar facility would occupy 2,403 acres on privately owned land under the jurisdiction of the County, and would be within the PVVAP. As no development would occur north of I-10, there would be no portion of Alternative 5 within the City of Blythe limits (only City of Blythe sphere of influence), as compared to Alternative 1. The above-ground 230 kV gen-tie line would connect two rather than three proposed on-site substations, extending a distance of approximately three miles within the solar facility. From the southernmost on-site substation to the Colorado River Substation, the gen-tie line would extend another 4.8 miles within a 125-foot-wide ROW, or 73 acres (traversing 3.8 miles [58 acres] of BLM-managed lands and one mile of private land [15 acres]), similar to Alternative 1.

Federal

Lands traversed by the proposed Project and Alternatives under the jurisdiction of the BLM would be subject to the same plans and policies as detailed under Alternative 1. The Alternative 1 analysis would apply.

Local

Lands that would be traversed by Alternative 5 would be subject to the local plans and policies detailed in the Alternative 1 analysis. No development of Alternative 5 would occur north of I-10 and in the City of Blythe limits; the City of Blythe Zoning Code would not apply.

Riverside County Airport Land Use Compatibility Plan (RCALUCP) and Federal Aviation Administration

In April 2012, the Riverside County ALUC found the Alternative 1 Project to be consistent with the RCALUCP. In addition, the FAA provided "No Hazard to Air Navigation" determinations for the 230 kV gen-tie line structures. Alternative 5 would develop a reduced footprint within the same area as Alternative 1; as such, the same determinations would apply to Alternative 5.

Compatibility with Local Plans and Policies

Alternative 1 would be generally consistent with policies and goals set forth in the RCGP, PVVAP, and City of Blythe General Plan 2025. In addition, Alternative 1 would be consistent with the Riverside County Zoning Ordinance (Ordinance 348) and City of Blythe Zoning Code. As Alternative 5 would develop within the same footprint as Alternative 1, the same compatibility with local plans and policies would apply, as detailed in Table 4.2.10-1 within the Alternative 1 analysis. Under Alternative 5, solar facility development would not occur north of I-10 and within the City limits of Blythe; however, the Reduced Acreage Alternative would occur within the City's Sphere of Influence.

Construction, Operation, and Maintenance

The discussion above regarding compatibility with applicable land use plans and policies applies to construction, operation, and maintenance of the proposed Project and Alternatives. Following construction, the gen-tie line would be accessed using only roadways that are necessary to maintain it. The gen-tie line would be operated and maintained primarily within Corridor K, and fully within the Riverside East SEZ. Maintenance activities would be confined to existing roadways and disturbed areas. Therefore, operation and maintenance of Alternative 5 would be consistent with the CDCA Plan and NECO Plan.

Decommissioning

At the end of the operational life of Alternative 5, all equipment and components would be decommissioned and deconstructed. Structures used to support above-ground wires would be removed. A ROW grant from the BLM and CUP from Riverside County would no longer be required.

Application of CEQA Significance Thresholds

LU-1) Would Alternative 5 physically divide an established community?

Similar to Alternative 1, Alternative 5 would not physically divide an established community. Alternative 5 would be east and south of an existing community (Nicholls Warm Springs/Mesa Verde), south of I-10. The gen-tie line, access roads, and 34.5 kV distribution line would not be located through an established community. No impacts would occur.

LU-2) Would Alternative 5 conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project (including but not limited to the general plan,

specific plan, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Alternative 5 would be subject to the RCGP, PVVAP, CDCA Plan, and NECO Plan. As summarized in Table 4.2.10-1 under the analysis for Alternative 1, the Project would not conflict with applicable local land use plans, policies, or regulations (with the exception of Land Use Element Policy LU 13). Similar to Alternative 1, Alternative 5 would be consistent with goals and policies related to agriculture (Riverside County Land Use Element Policy LU 16.4, PVVAP Agricultural Preservation Policy 4.1). With approval of a CUP, Alternative 5 would be a permitted use on private land. The gen-tie line structures proposed on BLM land would be within the Riverside East SEZ and therefore consistent with the CDCA Plan and NECO Plan. Impacts to existing plans, policies, and regulations would be considered less than significant.

LU-3) Would Alternative 5 conflict with any applicable habitat conservation plan or natural community conservation plan?

As discussed in Section 4.2.4, *Biological Resources*, Alternative 5 would not be within the jurisdiction of any adopted habitat conservation plan or natural community conservation plan; therefore, no impacts would occur.

LU-4) Would Alternative 5 increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Similar to Alternative 1, Alternative 5 would not contain a residential component that would result in long-term increased use of existing recreational facilities. During the three-year construction period, construction workers and their families may temporarily increase the use of recreational facilities; however, Alternative 5 is not expected to draw a substantial number of new employees to the area over the long term. Therefore, implementation of Alternative 5 is not expected to result in any substantial physical deterioration of existing facilities. Impacts would be less than significant.

LU-5) Would Alternative 5 include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Similar to Alternative 1, Alternative 5 would not include any plans for the addition of any recreational facilities, nor would it require the construction or expansion of recreational facilities. The LU-5 analysis for Alternative 1 would apply.

LU-6) Would Alternative 5 result in a substantial alteration of the present or planned land use of an area?

Alternative 5 would be on private lands south of I-10 that would be conditionally consistent (with approval of the CUP) with the RCGP and the PVVAP. The gen-tie line within BLM-managed lands would be consistent with the CDCA Plan and NECO Plan, because it would be within the Riverside East SEZ. Therefore, Alternative 5 would be consistent with present or planned land use of the area.

LU-7) Would Alternative 5 affect land use within a city sphere of influence and/or within adjacent city or county boundaries?

Unlike Alternative 1, Alternative 5 would not develop solar facilities within the City of Blythe limits, only within the City's Sphere of Influence; the gen-tie line that would extend outside of the solar facility would not be within the City's Sphere of Influence. As discussed above, and similar to Alternative 1, Alternative 5 would be conditionally consistent with the RCGP and PVVAP. Therefore, no impacts would occur.

LU-8) Would Alternative 5 be inconsistent with the site's existing or proposed zoning?

As described in LU-6 above, the solar facility for Alternative 5 would be conditionally consistent with existing zoning for the RCGP and PVVAP. The gen-tie line would be consistent with the CDCA Plan and NECO Plan. Development of Alternative 5 would not require a zone change or general plan amendment; therefore, Alternative 5 would be consistent with the site's existing zoning. No impacts would occur.

LU-9) Would Alternative 5 be incompatible with existing surrounding zoning?

Alternative 5 would not develop within the City of Blythe limits. The zoning surrounding Alternative 5 is similar to that of the Alternative 1 site; therefore, Alternative 5 would be compatible with existing surrounding zoning.

LU-10) Would Alternative 5 disrupt or divide the physical arrangement of an established community (including a low-income or minority community)?

Similar to Alternative 1, Alternative 5 would not be located through an established community (see LU-1). No impacts would occur.

Cumulative Impacts

Geographic Scope

Impacts resulting from construction, operation, maintenance, and decommissioning of the Project could result in a cumulative effect on land use with other past, present, or reasonably foreseeable future actions. Cumulative impacts to agriculture are addressed in Section 4.2.2, *Agriculture*. The geographic scope of the cumulative effects analysis for land use consists of eastern Riverside County. This is based on the jurisdictional boundaries within which the impacts of land use decisions of the BMSP and other projects described in Table 4.1-1 could be additive or synergistic.

Temporal Scope

The timeframe refers to the duration over which impacts associated with land use and special designations would occur: short-term or long-term. Short-term impacts to land use and special designations would occur during the construction and decommissioning period. Long-term impacts associated with land use and special designations would occur as a result of developing a solar facility on the Project area and the resulting change in land use to accommodate the Project over its operational life (approximately 25 years).

Analysis of Direct and Indirect Impacts

Alternative 1: Proposed Project

Construction, Operation, Maintenance, and Decommissioning

Impacts resulting from construction, operation, maintenance, and decommissioning of the proposed Project could contribute to a cumulative effect on land use with other past, present, or reasonably foreseeable future actions. Cumulative impacts to agriculture are addressed in Section 4.2.2, *Agriculture*. The geographic scope of the cumulative effects analysis for land use consists of eastern Riverside County. This is based on the jurisdictional boundaries within which the impacts of land use decisions of the proposed Project and other projects described in Table 4.1-1 could be additive or synergistic.

Past development has increased human use of land in the Project area. However, because of the limited availability of water, human development in the Project area has been limited to small scattered communities and cities among large tracts of undeveloped land. Past and present projects occurring in the vicinity of the proposed Project area on private lands primarily include agricultural operations. Overall,

the Project area consists of undeveloped land used for agriculture, open space land, and desert. In addition, a large number of renewable projects (solar) have been proposed on both BLM-administered land and private land. However, not all projects listed would complete the environmental review process, and not all projects would be funded and constructed. Therefore, it is unlikely that all of the projects would be constructed.

Cumulative land use conflicts could arise as a result of the proposed Project's or an Alternative's short-term construction period in combination with multiple projects being under construction, creating nuisances such as dust, exhaust, and noise. The Project area is in a rural portion of the county devoted predominantly to agriculture with few sensitive receptors. However, there are a few small residential communities that could be impacted by increased traffic volumes on roadways. Impacts associated with dust, exhaust, and noise would be addressed through mitigation measures discussed in Section 4.2.3, *Air Quality*, and Section 4.2.11, *Noise*, which would likely be imposed on the other cumulative projects (impact LU-2). The gen-tie line traverses BLM-managed lands. Please refer to Section 4.2.12, *Recreation* for a discussion regarding temporary impacts to BLM-managed lands from the construction of the gen-tie line. Once construction is completed, temporary land use conflicts would cease. Therefore, temporary cumulative impacts to land use during construction would not be considered significant.

Some, if not all, of the cumulative projects described in Table 4.1-1 are anticipated to be operational during the operational life of the proposed Project or an Alternative. As part of the acreage of land is proposed for solar development in eastern Riverside County, the proposed Project or an Alternative could contribute to these cumulative impacts to land use during operations and maintenance. The conversion of rural agricultural and desert lands to solar facilities would preclude existing land uses including agriculture, rangeland, and open space from continuing on these sites during the operational life of the projects. Existing surrounding land uses such as agricultural fields are considered compatible with solar projects. Although solar projects can be affected by dust as well as particles from periodic spraying being carried by the wind and depositing on PV panels, these would not be considered incompatibilities or conflicts. With approval of a CUP for the proposed Project or an Alternative, there would be no conflicts with the RCGP, City of Blythe General Plan 2025, or zoning (impact LU-2). Therefore, the proposed Project or an Alternative would not contribute to any adverse direct or indirect cumulative impact to land use during operations and maintenance.

The decommissioning of the proposed Project or an Alternative is expected to result in temporary impacts similar to construction impacts, but lasting for a shorter period. Decommissioning of other solar energy projects would have the potential to combine with the proposed Project or an Alternative to result in temporary land use conflicts similar to construction (e.g., increases in traffic, disruptions in accessibility to surrounding lands). However, due to the short-term nature of decommissioning activities, and the unlikelihood that all such projects would go through the decommissioning process at exactly the same time, the cumulative land use impacts (i.e., temporary conflicts or incompatibilities) would occur for a limited duration and are therefore not expected to be significant.

Alternative 2: No Project Alternative

Under the No Project Alternative, gen-tie facilities would not be constructed on BLM-managed lands and solar facilities would not be constructed on private lands. The public lands in the Project area would continue to be managed by BLM in accordance with existing land use designations in the CDCA Plan, whereas the private lands would continue to be managed for agricultural production. Alternative 2 would not contribute to cumulative impacts on land use and planning.

Alternative 3: Northern 230 kV Gen-tie Line Location

Alternative 3 is similar to Alternative 1 (proposed Project), with the exception of the location of the Northern 230 kV gen-tie line, which would be approximately 700 feet north of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1. Similar to Alternative 1, impacts resulting from construction, operation, maintenance, and decommissioning of Alternative 3 could result in a cumulative effect on land use with other past, present, or reasonably foreseeable future

actions. Cumulative impacts to agriculture are addressed in Section 4.2.2, *Agriculture*. The geographic scope of the cumulative effects analysis for land use consists of eastern Riverside County. This is based on the jurisdictional boundaries within which the impacts of land use decisions of Alternative 3 and other projects described in Table 4.1-1 could be additive or synergistic.

Past development has increased human use of land in the area of Alternative 3. However, because of the limited availability of water, human development in the Alternative 3 area has been limited to small scattered communities and cities among large tracts of undeveloped land. Past and present projects occurring in the vicinity of the Alternative 3 site on private lands primarily include agricultural operations. Overall, the Project area consists of undeveloped land used for agriculture, open space land, and desert. In addition, a large number of renewable projects (solar) have been proposed on both BLM-administered land and private land. However, not all projects listed would complete the environmental review process, and not all projects would be funded and constructed. Therefore, it is unlikely that all of the projects would be constructed.

As with the proposed Project, cumulative land use conflicts could arise as a result of this Alternative's short-term construction period in combination with multiple projects being under construction creating nuisances such as dust, exhaust, and noise. Alternative 3 would also be in a rural portion of the county devoted predominantly to agriculture with few sensitive receptors. However, there are a few small residential communities that could be impacted by increased traffic volumes on roadways. Impacts associated with dust, exhaust, and noise would be addressed through mitigation measures discussed in Section 4.2.3, *Air Quality*, and Section 4.2.11, *Noise*, which would likely be imposed on the other cumulative projects (impact LU-2). Once construction is completed, temporary land use conflicts would cease. Therefore, temporary cumulative impacts to land use during construction are not considered significant.

Some, if not all, of the cumulative projects described in Table 4.1-1 are anticipated to be operational during the operational life of Alternative 3. As part of the acreage of land is proposed for solar development in eastern Riverside County, Alternative 3 could contribute to these cumulative impacts to land use during operations and maintenance. The conversion of rural agricultural and desert lands to solar facilities would preclude existing land uses including agriculture, rangeland, and open space from continuing on these sites. Existing surrounding land uses such as agricultural fields are considered compatible with solar projects. Although solar projects can be affected by dust as well as particles from periodic spraying being carried by the wind and depositing on PV panels, these would not be considered incompatibilities or conflicts. With approval of a CUP and compliance with Board of Supervisor's Policy B-29 for Alternative 3, there would be no conflicts with the RCGP, City of Blythe General Plan 2025, or zoning (impact LU-2). Therefore, Alternative 3 would not contribute to any adverse direct or indirect cumulative impact to land use during operations and maintenance.

The decommissioning of Alternative 3 is expected also to result in temporary impacts similar to construction impacts, but lasting for a shorter period. Decommissioning of other solar energy projects would have the potential to combine with this Alternative to result in temporary land use conflicts similar to construction (e.g., increases in traffic, disruptions in accessibility to surrounding lands). However, due to the short-term nature of decommissioning activities, and the unlikelihood that all such projects would go through the decommissioning process at exactly the same time, the cumulative land use impacts (i.e., temporary conflicts or incompatibilities) would occur for a limited duration and are therefore not expected to be significant.

Alternative 4: Southern 230 kV Gen-tie Line Location

Alternative 4 is similar to Alternative 1 (proposed Project), with the exception of the location of the Southern 230 kV gen-tie line, which would be approximately 0.8 mile south of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1. Similar to Alternative 1, impacts resulting from construction, operation, maintenance, and decommissioning of Alternative 4 could result in a cumulative effect on land use with other past, present, or reasonably foreseeable future actions. Cumulative impacts to agriculture are addressed in Section 4.2.2, *Agriculture*. The geographic

scope of the cumulative effects analysis for land use consists of eastern Riverside County. This is based on the jurisdictional boundaries within which the impacts of land use decisions of Alternative 4 and other projects described in Table 4.1-1 could be additive or synergistic.

Past development has increased human use of land in the area of Alternative 4. However, because of the limited availability of water, human development in the Alternative 4 area has been limited to small scattered communities and cities among large tracts of undeveloped land. Past and present projects occurring in the vicinity of the Alternative 4 site on private lands primarily include agricultural operations. Overall, the Project area consists of undeveloped land used for agriculture, open space land, and desert. In addition, a large number of renewable projects (solar) have been proposed on both BLM-administered land and private land. However, not all projects listed would complete the environmental review process, and not all projects would be funded and constructed. Therefore, it is unlikely that all of the projects would be constructed.

As with the proposed Project, cumulative land use conflicts could arise as a result of this Alternative's short-term construction period in combination with multiple projects being under construction creating nuisances such as dust, exhaust, and noise. Alternative 4 would also be in a rural portion of the county devoted predominantly to agriculture with few sensitive receptors. However, there are a few small residential communities that could be impacted by increased traffic volumes on roadways. Impacts associated with dust, exhaust, and noise would be addressed through mitigation measures discussed in Section 4.2.3, *Air Quality*, and Section 4.2.11, *Noise*, which would likely be imposed on the other cumulative projects (impact LU-2). Once construction is completed, temporary land use conflicts would cease. Therefore, temporary cumulative impacts to land use during construction are not considered significant.

Some, if not all, of the cumulative projects described in Table 4.1-1 are anticipated to be operational during the operational life of Alternative 4. As part of the acreage of land is proposed for solar development in eastern Riverside County, Alternative 4 could contribute to these cumulative impacts to land use during operations and maintenance. The conversion of rural agricultural and desert lands to solar facilities would preclude existing land uses including agriculture, rangeland, and open space from continuing on these sites. Existing surrounding land uses such as agricultural fields are considered compatible with solar projects. Although solar projects can be affected by dust as well as particles from periodic spraying being carried by the wind and depositing on PV panels, these would not be considered incompatibilities or conflicts. With approval of a CUP and compliance with Board of Supervisor's Policy B-29 for Alternative 4, there would be no conflicts with the RCGP, City of Blythe General Plan 2025, or zoning (impact LU-2). Therefore, Alternative 4 would not contribute to any adverse direct or indirect cumulative impact to land use during operations and maintenance.

The decommissioning of Alternative 4 is expected also to result in temporary impacts similar to construction impacts, but lasting for a shorter period. Decommissioning of other solar energy projects would have the potential to combine with this Alternative to result in temporary land use conflicts similar to construction (e.g., increases in traffic, disruptions in accessibility to surrounding lands). However, due to the short-term nature of decommissioning activities, and the unlikelihood that all such projects would go through the decommissioning process at exactly the same time, the cumulative land use impacts (i.e., temporary conflicts or incompatibilities) would occur for a limited duration and are therefore not expected to be significant.

Alternative 5: Reduced Acreage Alternative

Construction, Operation, Maintenance, and Decommissioning

Similar to Alternative 1, impacts resulting from construction, operation, maintenance, and decommissioning of Alternative 5 could result in a cumulative effect on land use with other past, present, or reasonably foreseeable future actions. Cumulative impacts to agriculture are addressed in Section 4.2.2, *Agriculture*; however, unlike Alternative 1, no agricultural lands would be developed north of I-10 under Alternative 5. The cumulative land use analysis under Alternative 1 would apply. Overall, and

similar to Alternative 1, the Alternative 5 area consists of undeveloped land used for agriculture, open space land, and desert.

Once construction is completed, temporary land use conflicts would cease. Therefore, temporary cumulative impacts to land use during construction are not considered significant.

Some, if not all, of the cumulative projects described in Table 4.1-1 are anticipated to be operational during the operational life of Alternative 5. Similar to Alternative 1, Alternative 5 could contribute to cumulative impacts to land use during operations and maintenance. The conversion of rural agricultural and desert lands to solar facilities would preclude existing land uses including agriculture, rangeland, and open space from continuing on these sites; however, under Alternative 5 there would be no agricultural lands impacted north of I-10 and current agricultural uses could continue. There would be no additional contribution towards cumulative impacts or conflicts during operations and maintenance outside of those previously discussed in the cumulative land use analysis under Alternative 1.

Similar to Alternative 1, the decommissioning of Alternative 5 is expected to result in temporary impacts similar to construction impacts, but lasting for a shorter period. Under Alternative 5, decommissioning efforts would be reduced in comparison to Alternative 1 due to less solar facility development. No additional impacts outside of those identified in the Alternative 1 cumulative analysis for decommissioning would result.

Mitigation Measures

The design features of the Project, as well as its compliance with applicable laws, ordinances, regulations, and standards, and the use of industry standard operating procedures (e.g., WECC) would avoid or reduce impacts related to construction and operation of the Project. Moreover, utility corridors have been designated by the BLM to accommodate such uses and to reduce overall environmental impacts that would result from the construction and operation of multiple linear facilities in multiple locations. In addition, the location of the Project in the Riverside East SEZ facilitates utility-scale production of solar energy and associated transmission infrastructure development. Accordingly, additional mitigation measures are not recommended.

Residual Impacts

There would be less-than-significant impacts to existing authorized uses as a result of development under the proposed Project, the action Alternatives, and the cumulative scenario. Existing conditions would continue under Alternative 2 and would not result in cumulative impacts to land use and planning.

NEPA Conclusions

The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged. The Project and each of the action Alternatives would result in the direct and indirect impacts and contribution toward cumulative impacts that are described above, which would not be substantial. The Project and each of the action Alternatives would comply with all federal, State and local land use plans.

4.2.11 Noise

This section describes the impact analysis relating to noise for the proposed Project and Alternatives.

Methodology for Analysis

Noise and vibration impacts associated with the proposed Project and Alternatives would be created by short-term construction activities and by normal long-term operation of the solar facility, including noise from the tracker motors, electrical collection system, substation, and operation and maintenance activities.

Construction noise from the Project and Alternatives would include both on- and off-site noise sources. On-site noise sources would be generated by equipment associated with construction activities described in the proposed Project and Alternatives (see Chapter 2). Off-site construction noise would be generated by trucks delivering equipment and materials, as well as workers commuting to and from the proposed solar facility.

Operational noise associated with the Project would include off-site worker traffic; noise generated by the tracker motors, transformers, substation, and gen-tie line; and panel washing.

Noise associated with decommissioning would be similar to that of construction; however, it would be less intense and require a shorter duration.

For vibration impacts, human reactions and building damage potential have different thresholds depending on whether the vibration events are isolated discrete events or frequent/continuous events. Based on Caltrans' Transportation- and Construction-Induced Vibration Guidance Manual, building damage potential is based on cosmetic (not structural) damage to buildings or structures of various types and ages. Building damage categories are:

- Extremely Low: exceeds cosmetic damage threshold for extremely fragile historic buildings, ruins, or monuments
- Very Low: exceeds cosmetic damage threshold for fragile buildings
- Low: exceeds cosmetic damage threshold for historic buildings
- Moderate: exceeds cosmetic damage threshold for older residential buildings
- High: exceeds cosmetic damage threshold for newer residential buildings
- Very High: exceeds cosmetic damage thresholds for modern commercial and industrial buildings

A peak particle velocity (PPV) threshold of 0.20 inch per second (in/sec) was identified as the level of vibration impacts related to adverse human reaction and risk of architectural damage to normal buildings[7] (Caltrans 2004). This PPV threshold was used in this analysis to determine significant impacts associated with the proposed Project and Alternatives.

The purpose of this analysis is to identify and examine likely noise and vibration impacts from construction, operation and maintenance, and decommissioning of the Project and to recommend mitigation measures to minimize adverse affects. Though not an impact of the Project and thus not a subject encompassed under CEQA or NEPA, this section also discusses whether the Project (including its employees) would be exposed to substantial noise levels.

[7]Architectural damage could be structural damage, such as cracking of floor slabs, foundations, columns, beams, or wells, or cosmetic architectural damage, such as cracked plaster, stucco, or tile.

CEQA Significance Criteria

CEQA does not define what noise level increase would be considered substantial. Typically, an increase in noise level of at least 5 A-weighted decibels (dBA) is noticeable by most people and in a residential setting would not be a substantial adverse impact. An increase in noise level of 10 dBA is judged by most people as a doubling of the sound level, which would be considered a substantial adverse impact. Other factors that are considered in determining adverse noise impacts include: (1) the resulting combined noise level; (2) the duration and frequency of the noise; (3) the number of people affected; and (4) the land use designation of the affected receptor sites. Mitigation measures must be considered if potential adverse impacts to noise would occur from the construction, operation and maintenance, and decommissioning of the Project.

Typically, noise impacts due to construction activities are not considered substantial as long as construction activities are temporary, intermittently affect any one location, limit the use of heavy equipment and noise activities to daytime hours, implement all industry standard noise abatement measures for noise-producing equipment, and comply with any local construction noise ordinances.

Vibration-sensitive land uses would include high-precision manufacturing facilities or research facilities with optical and electron microscopes. None of these occur in the Project area. Therefore, a substantial impact resulting from excessive ground-borne vibration would depend on whether a nuisance, annoyance, or physical damage to any structure could occur.

The following was used to determine CEQA significance of impacts to noise and were derived from Appendix G of the CEQA Guidelines. Impacts of the proposed Project would be considered significant and would require mitigation if they result in:

NOI-1) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

NOI-2) Substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

NOI-3) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels.

NOI-4) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the exposure of people residing or working in the project area to excessive noise levels.

NOI-5) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project.

The following additional significance criterion from the County of Riverside Environmental Assessment form is used in the analysis. A project could have potentially significant impacts if it results in:

NOI-6) Impacts from railroad or highway noise.

CEQA significance conclusions are based on thresholds defined by local rules, standards, and/or ordinances. During operation of the Project, it is anticipated that noise levels would operate at or below the existing ambient noise levels.

NEPA Requirements

The federal role in regulating noise is mostly limited to transportation, workplace activities, and certain types of machinery. State and local governments determine the extent to which other sources of noise are controlled.

BLM does not have regulations specific to noise and the Riverside County noise ordinances are not applicable on public lands. However, the County General Plan and noise ordinance establishes sound-level limits applicable to residential properties that could be adversely affected by the Project. The noise ordinance is furthermore applicable to the non-federal connected action (the solar facility). The standards established in the County noise control measures accordingly provide applicable noise thresholds for evaluating the Project.

Applicable Best Management Practices

As part of the Project and Alternatives, the following applicable BMP would minimize the environmental impacts associated with noise. The full BMP has been detailed below (see also Table 2-4 in Chapter 2) and is further referenced (by number) within the impact discussion.

NUMBER	BMP DESCRIPTION
BMP-18	**Noise.** The Project would minimize construction- and operation-related noise levels to minimize impacts to wildlife and nearby residents.

Alternative 1: Proposed Project

Analysis of Direct and Indirect Impacts

Construction

Construction of the proposed Project would occur over a three-year period and construction workers would typically work Monday through Friday from 7:00 a.m. to 6:00 p.m. The peak of construction (construction of the solar field, O&M buildings, substations, and gen-tie line) would occur over a two-year period and require approximately 300 to 500 workers. Up to 400 workers would be at the site during array installation and assembly. The solar facility would be developed in six-month phases with six blocks constructed at a time (each block would be 100 acres, for a total of 600 acres at a time). Construction noises associated with each phase would accordingly move when construction activities move to the next phase.

Construction noise would be created from sources at the work sites and around staging areas or access routes. On-site noise generated during construction would occur primarily from heavy-duty diesel-powered construction equipment and other construction equipment. Off-site noise would be generated by trucks delivering materials and equipment to construction sites, as well as trucks hauling soil and vehicles used by workers commuting to and from the sites.

Noise from On-site Construction Activities

Construction equipment would include graders, bulldozers, backhoes, cranes, water trucks, generators, and delivery trucks. Table 4.2.11-1 provides the estimated noise that would be generated by each of the individual pieces of equipment, similar to what would be required to construct the Project, based on the Federal Highway Administration (FHWA) Roadway Construction Noise Model. Equipment and operation noise levels are expressed in terms of L_{max} (maximum sound level) noise levels. The acoustical usage factor estimates the fraction of time each piece of construction equipment is operating at full power (i.e., its loudest condition) during construction. Noise levels for each of the individual pieces of equipment would generate a maximum noise level ranging from 74 to 85 dBA L_{max} at 50 feet from the source, as shown in Table 4.2.11-1. With implementation of a Hearing Conservation Program and Personal Protective Equipment Program (Mitigation Measure Noise-3), impacts to construction workers would be reduced.

Table 4.2.11-1 Construction Equipment Noise Emission Levels

EQUIPMENT	ACOUSTICAL USAGE FACTOR (%)	MEASURED L_{max} (at 50 feet)
Backhoe	40	78
Compactor (ground)	20	83
Compressor (air)	40	78
Concrete Mixer Truck	40	79
Concrete Pump Truck	20	81
Dozer	40	82
Dump Truck	40	76
Excavator	40	81
Flat Bed Truck/Water Truck	40	74
Front End Loader	40	79
Truck-mounted crane	16	81
Generator	50	81
Grader	40	83
Paver	50	77
Pickup Truck	40	75
Pneumatic Tools	50	85
Pumps	50	81
Roller	20	80
Scraper	40	84
Welder/Torch	40	74

Source: FHWA 2006.

Based on similar solar projects, it is anticipated that the operation of heavy equipment for the construction of the Project would generate a combined maximum noise level of up to approximately 84 dBA L_{eq} (equivalent continuous noise level) at 75 feet from the construction activity (Aspen 2009). This noise level would diminish approximately 6 dBA per doubling of distance. At approximately 105 feet from the construction activity, noise levels would be approximately 78 dBA L_{eq} and at 300 feet, noise levels would be approximately 72 dBA L_{eq}. At approximately 1,200 feet from construction activity, it is anticipated that noise levels would be 60 dBA L_{eq}. Implementation of the Project would include BMP-18, which would minimize construction noise impacts to sensitive receptors and wildlife.

For the residents adjacent to the Project area, north of I-10 and west of the Project boundary, the assumed ambient noise level is 40 dBA L_{eq}. Projected ambient noise levels during construction are estimated to be 65 dBA L_{eq}. Within the County of Riverside, private construction projects located one-quarter of a mile or more from an inhabited dwelling or

The construction of the 230 kV gen-tie line, which is a long linear facility, would move along the length at a rapid pace and therefore would not subject any one sensitive noise receptor to noise impacts for more than a week. Furthermore, construction activities would be limited to daytime hours.

Off-site Noise

It is anticipated that most workers would be drawn from the Blythe/Palo Verde Valley region and the Desert Center region, with a smaller portion drawn from the Imperial Valley or Eastern Riverside County region. Anticipated average material deliveries would consist of about 20 truck deliveries per day for 24 months. Workers and delivery trucks would utilize the Neighbours Boulevard off ramp from I-10 and gain primary access to the site using Seeley Avenue and Riverside Drive. Typical on-site work hours would be from 7:00 a.m. to 6:00 p.m. During the installation period, construction workers are projected to be on-site five days per week, year-round. Due to weather or other major-type delays, times may shift to start as early as 5:00 a.m. and end as late as 8:00 p.m., as well as continue into the weekends. To minimize impacts to residents within 1,200 feet of construction activity to the maximum extent possible, non-typical construction hours would occur at a minimum of a quarter-mile (1,320 feet) from residents. Security would be on-site 24 hours per day.

Construction of the Project would cause off-site noise, primarily from commuting construction workers and materials and equipment deliveries to the construction sites. As shown in Table 4.2.11-1, the maximum pass-by noise levels from trucks would be 74 to 76 dBA L_{max} at 50 feet.

Vibration

Temporary sources of groundborne vibration and noise during construction would result from operation of conventional heavy construction equipment such as pile drivers, graders, bulldozers, and loaded haul trucks. Based on information from Caltrans' Transportation- and Construction-Induced Vibration Guidance Manual, Table 4.2.11-2 lists the anticipated ground vibration from typical construction equipment used to construct a solar facility. These pieces of equipment can generate vibration levels of up to 0.17 in/sec at a distance of 25 feet (Caltrans 2004).

Table 4.2.11-2 Ground Vibration Levels for Typical Construction Equipment

EQUIPMENT TYPE	VIBRATORY TYPE	PARAMETER	DISTANCE FROM OPERATING EQUIPMENT			
			25 feet	100 feet	200 feet	300 feet
Vibratory Pile Driver, Typical	Frequent or Continuous	PPV, in/sec	0.170	0.028	0.011	0.007
		Human Response	Mildly annoying	Barely perceptible	Barely perceptible	Not perceptible
		Building Damage Potential	Very low	None	None	None
Self-Loading Scraper	Frequent or Continuous	PPV, in/sec	0.089	0.015	0.006	0.004
		Human Response	Distinctly perceptible	Barely perceptible	Not perceptible	Not perceptible
		Building Damage Potential	Extremely low	None	None	None
Static Roller-Compactor	Frequent or Continuous	PPV, in/sec	0.089	0.015	0.006	0.004
		Human Response	Distinctly perceptible	Distinctly perceptible	Not perceptible	Not perceptible
		Building Damage Potential	Extremely low	None	None	none
Loaded Truck	Single Event	PPV, in/sec	0.076	0.013	0.005	0.003
		Human Response	Barely perceptible	Not perceptible	Not perceptible	Not perceptible
		Building Damage Potential	None	None	None	None
Small Bulldozer	Frequent or Continuous	PPV, in/sec	0.003	0.000	0.000	0.000
		Human Response	Not perceptible	Not perceptible	Not perceptible	Not perceptible
		Building Damage Potential	None	None	None	None
Excavator or Backhoe	Frequent or Continuous	PPV, in/sec	0.003	0.000	0.000	0.000
		Human Response	Not perceptible	Not perceptible	Not perceptible	Not perceptible
		Building Damage Potential	None	None	None	None
Wheeled Loader	Frequent or Continuous	PPV, in/sec	0.003	0.000	0.000	0.000
		Human Response	Not perceptible	Not perceptible	Not perceptible	Not perceptible
		Building Damage Potential	None	None	None	None

Source: BLM 2011.

For the construction of a solar facility, the vibratory pile driver would produce the highest PPV level of 0.17 in/sec at 50 feet, which would not exceed Caltrans' PPV threshold of 0.20 in/sec. The closest building, which is a residence, is approximately 260 feet from the proposed solar facility boundary and approximately 350 feet away from the closest solar panel. At a distance of 300 feet, ground vibration from a vibratory pile driver would not be perceptible by humans and would have no potential for damage to

buildings. Ground vibration from other construction equipment at 300 feet would not be perceptible to humans and would pose no risk of cosmetic damage to any existing buildings in the vicinity of the solar facility.

Operation and Maintenance

The primary noise sources associated with the operation and maintenance of the Project would be the tracker unit motors, substation transformers, modular power block inverters and medium voltage transformers, gen-tie line corona discharge, and maintenance activities.

Modular Power Blocks

The modular power blocks would each comprise four to six individual tracker units. Each tracker unit would include a drive unit that would consist of a 0.5-horsepower motor that would rotate the drive strut so that the solar PV panels would have the ability to maximize exposure to sunlight throughout the day. Based on specification of tracking motors for a similar PV project, the noise level of each proposed tracking motor is expected to be approximately 48 dBA at 50 feet (ICF 2010). Assuming that each of the six motors of a power block would operate simultaneously, the combined noise level would be as high as 50 dBA at 50 feet, which would equate to 44 dBA at 100 feet and 38 dBA at 200 feet.

The modular power blocks also include an inverter and medium voltage transformer. Inverters would be housed in containers that would attenuate any inverter noise to negligible levels. It is anticipated that the medium-voltage transformers would result in noise levels substantially less than the high-voltage transformers within the proposed substation (i.e., less than 53 dBA at 50 feet; see substation transformer discussion under *230 kV Gen-tie Line* below).

At 200 feet, the maximum power block combined motors and transformer noise would be less than 45 dBA. Although not typical, during the summer months, there may be days when the power block motors and medium transformers would operate slightly before 6:00 a.m. The closest residence is 260 feet from the Project boundary; noise attenuates with distance and would be less than 45 dBA, which is the County of Riverside's maximum decibel level limit allowed in rural residential areas for daytime and nighttime, as well as within the City of Blythe's acceptable noise levels.

O&M Buildings

After the construction phase, the O&M buildings would serve the Project's approximately 12 permanent full-time employees, which would include one plant manager, five engineers/technicians, and six security staff. Project facilities would be monitored during operating (daylight) hours, even though the Project facilities would be capable of automatic start up, shutdown, self-diagnosis, and fault detection. No heavy equipment would be used during normal operation.

Noise from the operation and maintenance of the Project would be created by security patrols, maintenance crews, wash crews, and the sound of electrical equipment, such as inverters and transformers. Security and maintenance staff would traverse the solar array field by utilizing lightweight vehicles along interior access roads. Panel washing crews would clean the panels up to twice a year with a lightweight to medium-duty truck. The truck would be fitted with a water tank and air compressor to operate a high-pressure sprayer and cleaning brush system.

230 kV Gen-tie Line

It is anticipated that the 230 kV gen-tie line would create a noise of approximately 20 dBA L_{eq} at 50 feet, and the transformers (within the substations) would create noise levels of approximately 40 dBA L_{eq} at 200 feet. The inverters would be housed in steel and concrete enclosures and are anticipated to create noise levels of approximately 58 dBA L_{eq} at the source.

AR072414

Decommissioning

Equipment used during decommissioning activities would be similar to those used during construction, including cranes, excavators, and air hammers. Decommissioning activities would generate a temporary, localized increase in ambient noise levels that would be similar, but less than, noise generated during construction. Decommissioning activities would be less intense and for a shorter duration.

Application of CEQA Significance Thresholds

NOI-1) Would the Project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction of the Project would occur over a three-year period, and the solar facility would be developed in six-month phases with six blocks (100 acres each) constructed at a time (approximately 600 acres at a time). Construction noises associated with each phase would accordingly move when construction activities move to the next phase. Construction activities would be temporary and only intermittently affect any one location. Typical construction hours would occur between 7:00 a.m. and 6:00 p.m., which would meet the criteria for exemption under provisions of Riverside County's Ordinance No. 847. Anticipated construction noise levels for the closest sensitive receptor, a residence approximately 260 feet away from the Project boundary, would not exceed the County of Riverside's and City of Blythe's noise policy thresholds (60 dB L_{dn}). However, noise levels for residents within 0.25 mile would increase greater than 10 dBA L_{eq} from the existing ambient noise level, which would result in an adverse impact. To minimize impacts to sensitive receptors, implementation of Mitigation Measure Noise-1 would restrict construction hours to comply with the County of Riverside's Noise Ordinance No. 847. In addition, implementation of BMP-18, as part of the Project, and Mitigation Measure Noise-2 to notify residents within 2,400 feet of the Project area would further minimize noise impacts. With implementation of Mitigation Measure Noise-3, impacts to workers that may be exposed to excessive noise levels would be reduced to less than significant levels. Impacts during operation and decommissioning would be less than significant. There are no sensitive receptors close to the proposed gen-tie line; therefore, no impacts would occur.

NOI-2) Would the Project result in substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Project construction would temporarily increase ambient noise levels in the Project vicinity above existing levels. However, construction would move along at a rapid pace throughout the Project area and would only intermittently affect any one location. Therefore, impacts would be considered less than significant.

NOI-3) Would the Project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Project construction activities would require the use of heavy construction equipment that would result in ground-borne vibration. The vibratory post driver used for installation of the solar array piles would result in the highest vibration levels; however, it would be below PPV thresholds and would not result in adverse impacts to humans or physical damage to buildings in the vicinity of the Project area. Therefore, construction-related vibration impacts would be less than significant. Impacts related to decommissioning would be similar to construction, but the construction equipment utilized for decommissioning would result in lower levels of ground vibration. Project operation would not introduce any new sources of perceivable ground-borne vibration to sensitive receptors surrounding the Project area. Therefore, there would be no operation-related vibration levels.

NOI-4) Would the Project result in for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use

AR072415

airport, the exposure of people residing or working in the project area to excessive noise levels?

The Project would be approximately 0.5 mile from the Blythe Airport, and the Project area also experiences considerable ambient noise from I-10. Construction activities from the Project would potentially exceed ambient levels for residents to the north of I-10 and east of the solar facility. Also, construction personnel working close to the Blythe Airport may be exposed to elevated noise levels from aircraft. With the implementation of Mitigation Measures Noise-1 and Noise-2, impacts would be reduced to a less than significant level. Noise impacts during operation and decommissioning would be less than significant.

NOI-5) Would the Project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

The Project would generate noise associated with the operation and maintenance of the tracker unit motors, substation transformers, modular power block inverters and medium voltage transformers, gen-tie line corona discharge, and maintenance activities. However, noise attenuates with distance and the Project would not result in a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project. Impacts would be less than significant.

NOI-6) Would the Project result in impacts from railroad or highway noise?

The Project would not utilize railroad service for delivery of materials or workers; therefore, no impacts related to railroad noise would occur. During construction, workers commuting to the Project area and delivery of materials would result in a slight increase in traffic along I-10. However, the Project's construction traffic would result in a nominal increase in highway noise. Therefore, impacts related to highway noise would be less than significant. No impacts related to highway noise during operation of the Project would occur.

Alternative 2: No Project

Under the No Project Alternative, no Project-related action involving short-term construction activities and long-term operation of the Project would occur and the associated noise levels would not be generated. The No Project Alternative would result in the continuation of agricultural use-related noise levels at the site. No significant impacts would occur with the implementation of the No Project Alternative.

Alternative 3: Northern Alternative 230 KV Gen-tie Line Location

Alternative 3 would be very similar to the proposed Project, with the exception of the location of the proposed 230 kV gen-tie line. Although the gen-tie line would be shifted to the north relative to the proposed Project, it would impact the same noise-sensitive receptors. Therefore, noise-related impacts would be similar for Alternative 3 and the proposed Project.

Application of CEQA Significance Thresholds

NOI-1) Would Alternative 3 result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Alternative 3 would meet the criteria under which the noise would be considered acceptable under Riverside County's Ordinance No. 847 and the City of Blythe's noise policies. However, noise levels for residents within 0.25 mile of the solar facility site would increase greater than 10 dBA L_{eq} from the existing ambient noise level, which would result in an adverse impact. Construction activities would be temporary and only intermittently affect any one location. To minimize impacts to sensitive receptors, implementation of Mitigation Measure Noise-1 would restrict construction hours. In addition, implementation of BMP-18, as part of Alternative 3, and Mitigation Measure Noise-2 to notify residents within 2,400 feet of the solar facility area would

further minimize noise impacts. With implementation of Mitigation Measure Noise-3, impacts to workers that may be exposed to excessive noise levels would be reduced to less than significant levels. Therefore, impacts during operation and decommissioning would be less than significant. There are no sensitive receptors within 0.25 mile of Alternative 3's gen-tie line that would extend outside the solar facility site; therefore, no impacts would occur.

NOI-2) Would Alternative 3 result in substantial temporary or periodic increase in ambient noise levels in the Alternative 3 vicinity above levels existing without Alternative 4?

Alternative 3 construction would temporarily increase ambient noise levels in the Alternative 3 vicinity above existing levels. However, construction would move along at a rapid pace throughout the Alternative 3 site and would only intermittently affect any one location. Therefore, impacts would be considered less than significant.

NOI-3) Would Alternative 3 result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction activities for Alternative 3 would require the use of heavy construction equipment that would result in ground-borne vibration. The vibratory post driver used for installation of the solar array piles would result in the highest vibration levels; however, it would be below PPV thresholds and would not result in adverse impacts to humans or physical damage to buildings in the vicinity of the Alternative 3. Therefore, construction-related vibration impacts would be less than significant. Impacts related to decommissioning would be similar to construction, but the construction equipment utilized for decommissioning would result in lower levels of ground vibration. Project operation would not introduce any new sources of perceivable ground-borne vibration to sensitive receptors within 0.25 mile of Alternative 3. Therefore, there would be no operation-related vibration levels.

NOI-4) Would Alternative 3 result in for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the exposure of people residing or working in Alternative 3 area to excessive noise levels?

Alternative 3 would be approximately 0.5 mile from the Blythe Airport, and the Alternative 3 area also experiences considerable ambient noise from I-10. Construction activities from Alternative 3 would potentially exceed ambient levels for residents to the north of I-10 and east of the Solar facility. With the implementation of Mitigation Measures Noise-1 and Noise-2, impacts would be reduced to a less than significant level. Noise impacts during operation and decommissioning would be less than significant.

NOI-5) Would Alternative 3 result in a substantial permanent increase in ambient noise levels in the Alternative 3 vicinity above levels existing without Alternative 3?

Alternative 3 would generate noise associated with the operation and maintenance of the tracker unit motors, substation transformers, modular power block inverters and medium voltage transformers, gen-tie line corona discharge, and maintenance activities. However, noise attenuates with distance and Alternative 3 would not result in a substantial permanent increase in ambient noise levels in the Alternative 3 vicinity above levels existing without Alternative 3. Impacts would be less than significant.

NOI-6) Would Alternative 3 result in impacts from railroad or highway noise?

Similar to Alternative 1, Alternative 3 would not result in impacts related to railroad noise. During construction, Alternative 3 would result in a nominal increase in highway noise, but operation of Alternative 3 would not increase highway noise. Impacts related to highway noise would be less than significant.

AR072417

Alternative 4: Southern Alternative 230 KV Gen-tie Line Location

Alternative 4 would be similar to the proposed Project, with the exception of the location of the proposed 230 kV gen-tie line. Alternative 4 would be shifted to the south of the proposed Project's gen-tie line. Alternative 4's gen-tie line would be slightly shorter than the proposed Project's gen-tie line and farther from sensitive receptors. However, the closest residents that may be impacted by the Project would be close to the solar facility, not the gen-tie line. Therefore, there would be no substantial difference between the Alternative 4 gen-tie line and the proposed Project's gen-tie line, and the same noise-sensitive receptors would be impacted.

Application of CEQA Significance Thresholds

NOI-1) Would Alternative 4 result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Alternative 4 would meet the criteria under which the noise would be considered acceptable under Riverside County's Ordinance No. 847 and the City of Blythe's noise policies. However, noise levels for residents within 0.25 mile of the solar facility site would increase greater than 10 dBA L_{eq} from the existing ambient noise level, which would result in an adverse impact. Construction activities would be temporary and only intermittently affect any one location. To minimize impacts to sensitive receptors, implementation of Mitigation Measure Noise-1 would restrict construction hours. In addition, implementation of BMP-18, as part of Alternative 4, and Mitigation Measure Noise-2 to notify residents within 2,400 feet of the solar facility area would further minimize noise impacts. With implementation of Mitigation Measure Noise-3, impacts to workers that may be exposed to excessive noise levels would be reduced to less than significant levels. Therefore, impacts during operation and decommissioning would be less than significant. There are no sensitive receptors within 0.25 mile of Alternative 4's gen-tie line that would extend outside the solar facility site; therefore, no impacts would occur.

NOI-2) Would Alternative 4 result in substantial temporary or periodic increase in ambient noise levels in the Alternative 4 vicinity above levels existing without Alternative 4?

Alternative 4 construction would temporarily increase ambient noise levels in the Project vicinity above existing levels. However, construction would move along at a rapid pace throughout the Alternative 4 site and would only intermittently affect any one location. Therefore, impacts would be considered less than significant.

NOI-3) Would Alternative 4 result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Construction activities for Alternative 4 would require the use of heavy construction equipment that would result in ground-borne vibration. The vibratory post driver used for installation of the solar array piles would result in the highest vibration levels; however, it would be below PPV thresholds and would not result in adverse impacts to humans or physical damage to buildings in the vicinity of the Alternative 4. Therefore, construction-related vibration impacts would be less than significant. Impacts related to decommissioning would be similar to construction, but the construction equipment utilized for decommissioning would result in lower levels of ground vibration. Project operation would not introduce any new sources of perceivable ground-borne vibration to sensitive receptors within 0.25 mile of Alternative 4. Therefore, there would be no operation-related vibration levels.

NOI-4) Would Alternative 4 result in for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the exposure of people residing or working in Alternative 4 area to excessive noise levels?

Alternative 4 would be approximately 0.5 mile from the Blythe Airport, and the Project area also experiences considerable ambient noise from I-10. Construction activities from the Project would potentially exceed ambient levels for residents to the north of I-10 and east of the solar facility. With the implementation of Mitigation Measures Noise-1 and Noise-2, impacts would be reduced to a less than significant level. Noise impacts during operation and decommissioning would be less than significant.

NOI-5) Would Alternative 4 result in a substantial permanent increase in ambient noise levels in the Alternative 4 vicinity above levels existing without Alternative 4?

Alternative 4 would generate noise associated with the operation and maintenance of the tracker unit motors, substation transformers, modular power block inverters and medium voltage transformers, gen-tie line corona discharge, and maintenance activities. However, noise attenuates with distance, and the Project would not result in a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project. Impacts would be less than significant.

NOI-6) Would Alternative 4 result in impacts from railroad or highway noise?

Similar to Alternatives 1 and 3, Alternative 4 would not result in impacts related to railroad noise. During construction, Alternative 4 would result in a nominal increase in highway noise, but operation of Alternative 4 would not increase highway noise. Impacts related to highway noise would be less than significant.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Alternative 5 would include approximately 2,403 acres for the solar field. Similar to the proposed Project, 73 acres would be utilized for the 230 kV gen-tie line. In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building and would have one access point (planned on Seeley Avenue). The Reduced Acreage Alternative would also no longer extend a 230 kV overhead gen-tie line from an on-site substation north of I-10, as this Alternative would not be developed on land north of I-10. Instead, this Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility. Alternative 5 would avoid impacts that would result from the construction, operation, maintenance, and decommissioning of a solar development north of I-10; however, the land on which Alternative 1 is proposed would continue with existing uses. Under Alternative 5, the work-related action involving short-term construction activities and long-term operation of a solar facility north of I-10 would not occur and the associated noise levels would not be generated. As a result, there would be a continuation of agricultural use-related noise levels north of I-10.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but not within the City limits of Blythe in comparison to the proposed Project. Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The construction, operation, maintenance, and decommissioning of Alternative 5 would not exceed those noise impacts identified under the Alternative 1 analysis. Therefore,

the Alternative 1 analysis would be applicable to Alternative 5, outside of those differences identified in the discussion below.

Analysis of Direct and Indirect Impacts

Construction

Construction of Alternative 5 would occur over a three-year period, similar to Alternative 1, and construction workers would typically work Monday through Friday from 7:00 a.m. to 6:00 p.m. The peak of construction (construction of the solar field, O&M building, substation, and gen-tie line) would occur over a two-year period and require a slightly reduced amount of workers (approximately 200 to 400 workers) due to a smaller development footprint. As no construction would occur north of I-10, the analysis under Alternative 1 would apply.

Noise from On-site Construction Activities

Alternative 5 would utilize the same construction equipment as Alternative 1. The analysis under Alternative 1 would apply. Unlike Alternative 1, there would be no residents adjacent to the solar facility footprint area, north of I-10 and west of the Project boundary, which would be impacted by ambient noise levels under Alternative 5.

Off-site Noise

Construction of Alternative 5 would be similar to Alternative 1, with the difference of no construction occurring north of I-10. Off-site noise to receptors north of I-10 would be reduced. Similar to Alternative 1, it is anticipated that most workers would be drawn from the Blythe/Palo Verde Valley region and the Desert Center region, with a smaller portion drawn from the Imperial Valley or Eastern Riverside County region. Anticipated average material deliveries would consist of about 20 truck deliveries per day for 24 months. However, under Alternative 5, workers and delivery trucks would utilize the Neighbours Boulevard off ramp from I-10 and gain primary access to the site using Seeley Avenue. Similar to Alternative 1, construction of Alternative 5 would cause off-site noise, primarily from commuting construction workers and materials and equipment deliveries to the construction sites. As shown in Table 4.2.11-1 in the Alternative 1 analysis, the maximum pass-by noise levels from trucks would be 74 to 76 dBA L_{max} at 50 feet.

Vibration

As construction of Alternative 5 would be similar to Alternative 1, the analysis under Alternative 1 for vibration would apply. Alternative 5 would not exceed Caltrans' PPV threshold of 0.20 in/sec, similar to Alternative 1. As no development would occur north of I-10 under Alternative 5, no construction activities would occur in proximity to a residence that would be approximately 260 feet from the Alternative 1 solar facility boundary. At a distance of 300 feet, however, ground vibration from a vibratory pile driver would not be perceptible by humans and would have no potential for damage to buildings. As such, similar to Alternative 1, ground vibration from other construction equipment at 300 feet would not be perceptible to humans and would pose no risk of cosmetic damage to any existing buildings in the vicinity of the Alternative 5 solar facility.

Operation and Maintenance

Similar to Alternative 1, the primary noise sources associated with the operation and maintenance of Alternative 5 would be the tracker unit motors, substation transformers, modular power block inverters and medium voltage transformers, gen-tie line corona discharge, and maintenance activities.

Modular Power Blocks

The closest residence to the Alternative 1 boundary would not experience solar development within 260 feet under Alternative 5, as the project limits would not extend north of I-10. However, even under Alternative 1, noise would be less than 45 dBA, which is the County of Riverside's maximum decibel level limit allowed in rural residential areas for daytime and nighttime. As such, Alternative 5 operation would also be within these acceptable limits.

O&M Buildings

After the construction phase of Alternative 5, the O&M building would serve the Project's approximately seven permanent full-time employees. Similar to Alternative 1, Alternative 5 facilities would be monitored during operating (daylight) hours, even though the facilities would be capable of automatic start up, shutdown, self-diagnosis, and fault detection. No heavy equipment would be used during normal operation. As no solar facilities (no O&M building) would be developed north of I-10, there would be no associated activity in this area. The impacts south of I-10 would be similar to those described under Alternative 1.

230 kV Gen-tie Line

The Reduced Acreage Alternative would no longer extend a 230 kV overhead gen-tie line from an on-site substation north of I-10, as this Alternative would eliminate all development north of I-10. Therefore, the approximately 8.4-mile-long line associated with the proposed Project would be reduced under this alternative. The Reduced Acreage Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility. The impacts described under the Alternative 1 analysis would apply to the 230 kV gen-tie line in the areas previously described.

Decommissioning

The analysis under Alternative 1 would apply to the area south of I-10 regarding decommissioning efforts.

Application of CEQA Significance Thresholds

NOI-1) Would Alternative 5 result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

The NOI-1 analysis for Alternative 1 would apply to Alternative 5 and the Reduced Acreage Alternative would not exceed the noise generation levels under the proposed Project. As no development would occur north of I-10 under Alternative 5, there would be no significant temporary or intermittent construction noise level effects on the closest sensitive receptor, a residence approximately 260 feet away from the Alternative 1 Project boundary. Impacts to workers that may be exposed to excessive noise levels would be less than significant impacts. Impacts during operation and decommissioning would be less than significant. There are no sensitive receptors close to the proposed gen-tie line; therefore, no significant impacts would occur.

NOI-2) Would Alternative 5 result in substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

The NOI-2 analysis for Alternative 1 would apply to Alternative 5.

NOI-3) Would Alternative 5 result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

The NOI-3 analysis for Alternative 1 would apply to Alternative 5. Alternative 5 would not exceed Caltrans' PPV threshold of 0.20 in/sec, similar to Alternative 1. As no development would occur north of I-10 under Alternative 5, no construction activities would occur in proximity to a residence that would be approximately 260 feet from the Alternative 1 solar facility boundary. At a distance of 300 feet, however, ground vibration from a vibratory pile driver would not be perceptible by humans and would have no potential for damage to buildings. As such, similar to Alternative 1, ground vibration from other construction equipment at 300 feet would not be perceptible to humans and would pose no risk of cosmetic damage to any existing buildings in the vicinity of the Alternative 5 solar facility. Construction-related vibration impacts would be less than significant. Impacts related to decommissioning would be similar to construction, but the construction equipment utilized for decommissioning would result in lower levels of ground vibration. Alternative 5 operations would not introduce any new sources of perceivable ground-borne vibration to sensitive receptors surrounding the Alternative 5 area. Therefore, there would be no operation-related vibration levels.

NOI-4) Would Alternative 5 result in for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the exposure of people residing or working in the project area to excessive noise levels?

The NOI-4 analysis for Alternative 1 would apply to Alternative 5. However, Alternative 5 would be south of I-10 and farther from the Blythe Airport in comparison to Alternative 1. Construction activities from Alternative 5 would not have the potential to exceed ambient levels for residents to the north of I-10 and east of the solar facility, as no development would occur north of the freeway. Noise impacts during operation and decommissioning would be less than significant.

NOI-5) Would Alternative 5 result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

The NOI-5 analysis for Alternative 1 would apply to Alternative 5. Alternative 5 would not result in a substantial permanent increase in ambient noise levels in the vicinity above levels existing without the development. Impacts would be less than significant.

NOI-6) Would Alternative 5 result in impacts from railroad or highway noise?

The NOI-6 analysis for Alternative 1 would apply to Alternative 5.

Cumulative Impacts

Geographic Scope

Noise levels generally diminish quickly with distance from a source; therefore, the geographic scope for cumulative impacts associated with noise would be limited to projects within approximately 0.5 mile of the Project. The following projects were identified as reasonably foreseeable projects within 0.5 mile of the Project and Alternatives, and could be constructed and operated simultaneously with the Project: Palo Verde Mesa Solar Project, Blythe Airport Solar I Project, Blythe Energy Project II, Desert Quartzite, Sonoran West SEGS, Desert Southwest 500 kV Transmission Line, and Devers-Palo Verde #2 500 kV Transmission Line.

Temporal Scope

The temporal scope of the cumulative impacts associated with noise would include construction, operation and maintenance, and decommissioning phases of the Project. The timeframe refers to the duration over which an impact would occur: short-term or long-term. Short-term noise impacts would

occur during the construction and decommissioning periods in association with the addition of construction equipment.

Analysis of Direct and Indirect Impacts

Alternative 1: Proposed Project

Construction, Operation, Maintenance, and Decommissioning

The primary noise sources in the vicinity of the proposed Project and Alternatives area are traffic from I-10 and nearby roadways, airplane noise from the Blythe Airport, steam blowing from the Blythe Energy Center, and sounds from agricultural operations. The existing noise levels in the immediate Project vicinity are generally low, with the highest noise levels closest to I-10. I-10 bisects the proposed Project, and other proposed cumulative projects listed above would be farther away from the freeway. Project construction and decommissioning activities would result in short-term noise impacts at the nearest residence locations (impacts NOI-1 and NOI-2). Long-term operation- and maintenance-related impacts associated with the Project would not result in permanent impacts to noise (impact NOI-5). The Project would not have vibration- or ground-borne noise-related impacts.

Although unlikely, it is possible that construction and operation of the solar projects and electrical facilities listed above could occur at the same time as construction of the Project. However, the other cumulative projects would be at a greater distance from the existing sensitive receptors that would experience negligible noise levels from construction, operation, maintenance, and decommissioning of the Project. Additionally, the primary noise sources in the Project area are traffic from I-10 and airplane noise from the Blythe Airport.

Noise levels during decommissioning would be similar to those projected during Project construction since it is anticipated that the equipment used during decommissioning would be similar to that used during construction. The noise levels would be temporary and, similar to construction-related noise levels, would be expected to attenuate to a level of insignificance prior to reaching any sensitive noise receptors. In addition, decommissioning activities would be required to comply with local, State, and federal laws, regulations, and standards at the time of decommissioning. Thus, decommissioning activities would not be expected make a cumulative contribution to existing noise levels.

Therefore, it is unlikely that Project-related noise levels and other Project noise levels would result in a combined noise level that would cause an adverse effect.

Alternative 2: No Project Alternative

Under the No Project Alternative, gen-tie facilities would not be constructed on BLM-managed lands and solar facilities would not be constructed on private lands. The public lands in the Project area would continue to be managed by BLM in accordance with existing land use designations in the CDCA Plan, whereas the private lands would continue to be managed for agricultural production. Alternative 2 would not contribute to cumulative noise impacts.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 is similar to Alternative 1 (proposed Project), with the exception of the location of the Northern 230 kV gen-tie line, which would be approximately 700 feet north of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1.

As with the proposed Project, the primary noise sources in the vicinity of the Alternative 3 area are traffic from I-10 and nearby roadways, airplane noise from the Blythe Airport, steam blowing from the Blythe Energy Center, and sounds from agricultural operations. The existing noise levels in the immediate Project vicinity are generally low, with the highest noise levels closest to I-10. I-10 bisects the Alternative

development area, and other proposed cumulative projects listed above would be farther away from the freeway. Alternative 3 construction and decommissioning activities would result in short-term noise impacts at the nearest residence locations (impacts NOI-1 and NOI-2). Long-term operation- and maintenance-related impacts associated with Alternative 3 would not result in permanent impacts to noise (impact NOI-5). Alternative 3 would not have vibration- or ground-borne noise-related impacts.

Although unlikely, it is possible that construction and operation of the solar projects and electrical facilities listed above could occur at the same time as construction of Alternative 3. However, the other cumulative projects would be at a greater distance from the existing sensitive receptors that would experience negligible noise levels from construction, operation, maintenance, and decommissioning of Alternative 3. Additionally, the primary noise sources in the Alternative 3 area are traffic from I-10 and airplane noise from the Blythe Airport.

Noise levels during decommissioning would be similar to those projected during Alternative 3 construction since it is anticipated that the equipment used during decommissioning would be similar to that used during construction. The noise levels would be temporary and, similar to construction-related noise levels, would be expected to attenuate to a level of insignificance prior to reaching any sensitive noise receptors. In addition, decommissioning activities would be required to comply with local, State, and federal laws, regulations, and standards at the time of decommissioning. Thus, decommissioning activities would not be expected make a cumulative contribution to existing noise levels.

Alternative 4: Southern 230 kV Gen-tie Line Location

Alternative 4 is similar to Alternative 1 (proposed Project), with the exception of the location of the Southern 230 kV gen-tie line, which would be approximately 0.8 mile south of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1.

As with the proposed Project, the primary noise sources in the vicinity of the Alternative 4 area are traffic from I-10 and nearby roadways, airplane noise from the Blythe Airport, steam blowing from the Blythe Energy Center, and sounds from agricultural operations. The existing noise levels in the immediate Project vicinity are generally low, with the highest noise levels closest to I-10. I-10 bisects the Alternative development area, and other proposed cumulative projects listed above would be farther away from the freeway. Alternative 4 construction and decommissioning activities would result in short-term noise impacts at the nearest residence locations (impacts NOI-1 and NOI-2). Long-term operation- and maintenance-related impacts associated with Alternative 4 would not result in permanent impacts to noise (impact NOI-5). Alternative 4 would not have vibration- or ground-borne noise-related impacts.

Although unlikely, it is possible that construction and operation of the solar projects and electrical facilities listed above could occur at the same time as construction of Alternative 4. However, the other cumulative projects would be at a greater distance from the existing sensitive receptors that would experience negligible noise levels from construction, operation, maintenance, and decommissioning of Alternative 4. Additionally, the primary noise sources in the Alternative 4 area are traffic from I-10 and airplane noise from the Blythe Airport.

Noise levels during decommissioning would be similar to those projected during Alternative 4 construction since it is anticipated that the equipment used during decommissioning would be similar to that used during construction. The noise levels would be temporary and, similar to construction-related noise levels, would be expected to attenuate to a level of insignificance prior to reaching any sensitive noise receptors. In addition, decommissioning activities would be required to comply with local, State, and federal laws, regulations, and standards at the time of decommissioning. Thus, decommissioning activities would not be expected make a cumulative contribution to existing noise levels.

Alternative 5: Reduced Acreage Alternative

Construction, Operation, Maintenance, and Decommissioning

As development of Alternative 5 would occur within the same footprint as Alternative 1, the primary noise sources in the vicinity of the proposed Project and Alternatives area are traffic from I-10 and nearby roadways, airplane noise from the Blythe Airport, steam blowing from the Blythe Energy Center, and sounds from agricultural operations. The cumulative analysis under Alternative 1 would be applicable to Alternative 5; however, would have a smaller footprint in comparison to Alternative 1 and no development north of I-10 would result in a slightly reduced contribution towards noise impacts. Decommissioning activities would not be expected make a cumulative contribution to existing noise levels. It is unlikely that Alternative 5-related noise levels and other project noise levels would result in a combined noise level that would cause a significant adverse effect.

Mitigation Measures

Noise-1 Construction shall be prohibited in areas within 0.25 mile (1,320 feet) of residents, between the hours of 6:00 p.m. and 6:00 a.m. during the months of June through September, and the hours of 6:00 p.m. and 7:00 a.m. during the months of October through May. During construction, best efforts should be made to locate stockpiling and/or vehicle staging areas as far as practicable from existing noise sensitive receptors (residential dwellings) nearest the Project area.

Noise-2 Prior to and during construction, decommissioning, and ground disturbing activities, the Applicant shall provide at least two weeks advance notice of construction and decommissioning. Notices shall be mailed directly to land owners and residents within 2,400 feet of all portions of the Project boundary, and signs shall be posted at the solar facility in areas accessible to the public. Notices shall announce when and where construction would occur; provide tips on reducing noise intrusion (e.g., closing windows facing the planned construction); and provide contact information for the local public liaison for any noise complaints.

Noise-3 The Applicant would implement a Hearing Conservation Program and Personal Protective Equipment Program that would provide personal protective devices for specific jobs that would produce excessive noise levels. The Applicant shall comply with the OSHA regulations on occupational noise exposure.

Residual Impacts After Mitigation

With implementation of the Project BMPs and mitigation measures, noise-related impacts would be reduced to less than significant levels.

NEPA Conclusions

The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged. The Project and each of the action Alternatives would result in the direct and indirect impacts and contribution toward cumulative impacts described above. Noise impacts, particularly those due to construction activities, are usually not considered to be significant as long as the activities are temporary and only intermittently affect any one location; the use of heavy equipment is limited to daytime hours; and all industry-standard noise abatement measures are implemented. The Project and any of the action Alternatives would comply with all federal, State, and local requirements in addition to the BMP and mitigation measures relating to noise and identified above. The Project and each of the action Alternatives would consequently not have significant noise impacts.

4.2.12 Paleontological Resources

This section describes the impact analysis relating to cultural and paleontological resources for the proposed Project and Alternatives.

Methodology for Analysis

As described in Chapter 3, the Project's paleontological investigation included: (1) review of available geologic and paleontologic literature pertinent to the site, including existing lists of fossils and fossil localities; (2) review of available environmental impact and/or geotechnical reports pertinent to development of the site; and (3) review of records at the San Bernardino County Museum and databases from the University of California, Berkeley Museum of Paleontology. The information in this section is based on the *Blythe Mesa Solar Project Paleontological Resources Survey Report*, prepared by John Minch and Associates, Inc. 2012 (provided in Appendix I of this Draft EIR/EA). The information was assigned a sensitivity classification (Society of Vertebrate Paleontology classification for private land, and Potential Fossil Yield Classification [PFYC] for BLM administered-lands). Based on those classifications, and in accordance with BLM protocol, potential impacts to paleontological resources by the proposed Project and Alternatives were determined.

CEQA Significance Criteria

The application of CEQA Significance Thresholds section describes the criteria used to determine which impacts should be considered potentially significant. Significance thresholds are based on criteria identified in Appendix G of the CEQA Guidelines (CCR, Title 14, Division 6, Chapter 3, Sections 1500-15387). A cultural resources impact is considered significant if implementation of the proposed Project would do any of the following:

- cause a substantial adverse change in the significance of a historical resource as defined in §15064.5;
- cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5;
- directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; or
- disturb any human remains, including those interred outside of formal cemeteries.

As defined, significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, or diagnostically important.

CEQA criteria indicate that a project could have potentially significant impacts to paleontological resources if it would:

PALEO-1) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

NEPA Requirements

As discussed in Chapter 3, the BLM adopted a paleontological resource assessment system known as the PFYC System. The PFYC system classifies geologic units based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts, with a higher class number indicating a higher potential. The requirements of NEPA are addressed under the direct and indirect impacts discussions below for the proposed Project and each Action Alternative.

Applicable Best Management Practices

As part of the Project and Alternatives, the following applicable BMPs would minimize the environmental impacts to cultural resources. The full BMPs have been detailed below (see also Table 2-4 in Chapter 2) and are further referenced (by number) within the impact discussion.

NUMBER	BMP DESCRIPTION
BMP-14	**Travel and traffic.** Vehicular traffic on-site shall be confined to existing or designated travel routes and designated work areas. Access to the construction site and staging areas shall be limited to authorized vehicles and only through the designated roads. The extent of habitat disturbance during construction shall be reduced by keeping vehicles on access roads and minimizing foot and vehicle traffic through undisturbed areas. To the extent practical, travel shall be limited to stabilized roads. Road maintenance activities shall avoid blading existing forbs and grasses in ditches and adjacent to roads. Abandoned roads and roads no longer needed shall be subsoiled to increase infiltration and reduce soil compaction, then recontoured and revegetated. Construction traffic shall avoid unpaved surfaces to the extent practical (to reduce the risk of compaction) and reduce speed to lessen fugitive dust emissions. On unpaved or unstabilized surfaces within the construction site, speed limits (e.g., 20 mph) shall be posted with visible signs and enforced to minimize airborne fugitive dust. Project vehicle speeds shall be limited in areas occupied by special-status animal species. Traffic shall stop to allow wildlife to cross roads. Shuttle vans or carpooling shall be used to reduce the amount of traffic on access roads. Workers shall be trained to comply with the speed limit, use good engineering practices, minimize the drop height of materials, and minimize the number and extent of disturbed areas. The Project developer shall enforce these requirements.
BMP-13	**Ground and surface disturbance.** Construction boundaries would be clearly delineated to minimize areas of ground and surface disturbance. Ground-disturbing activities shall be minimized, especially during the rainy season. To the maximum extent possible, construction-related activities (such as vehicle and foot traffic) would avoid areas with intact biological soil crusts. For cases in which impacts cannot be avoided, soil crusts would be salvaged and restored on the basis of recommendations by the County of Riverside and BLM once construction has been completed. Existing rocks, vegetation, and drainage patterns shall be preserved to the maximum extent possible. No paint or permanent discoloring agents shall be applied to rocks or vegetation (to indicate surveyor construction activity limits or for any other purpose). All stakes and flagging shall be removed from the construction area and disposed of in an approved facility. Where feasible, brush-beating, mowing, or use of protective surface matting rather than removing vegetation shall be employed. Clearing and disturbing of sensitive areas (e.g., steep slopes and natural drainages) and other areas shall be avoided outside the construction zone. Surface disturbance would be minimized by utilizing undulating surface disturbance edges; stripping, salvaging, and replacing topsoil; using contoured grading; controlling erosion; using dust suppression techniques; and restoring exposed soils to their original contour and vegetation.

Alternative 1: Proposed Project

Analysis of Direct and Indirect Impacts

Construction

Construction activities that may affect paleontological resources include excavation, heavy equipment usage and movement, drilling, and trenching for utilities. Grading for access roads could also directly impact paleontological resources. Known sedimentary units of Late Pleistocene to Recent age are exposed at the solar facility. Older alluvium (geologic unit Qpv), is known to contain significant paleontological resources in other parts of Southern California, and underlies the majority of the solar facility. Geologic unit Qpv is considered to be of high paleontological sensitivity under the Society of Vertebrate Paleontology classification, and has a PFYC of 3a (moderate). There is a high potential for significant paleontological resources on the portion of the site underlain by this geologic unit. Any grading and excavation during site preparation and construction would have high potential to impact significant nonrenewable paleontological resources that may be present within the boundaries of the solar facility.

AR072427

Excavation activities associated with construction of the Project's proposed 230 kV gen-tie line on previously undisturbed lands managed by the BLM could directly impact paleontologically sensitive geologic rock units with moderate fossil yield potential (PFYC 3a). Excavations of 20 to 30 feet in depth would be required in association with gen-tie structure construction and could also result in direct impacts to paleontological sensitive geologic rock units with a high fossil yield potential (only those portions of the ROW overlying Qpv).

Further, unauthorized collection of fossil materials, dislodging of fossils from their preserved environment, and/or physical damage of fossil specimens could also adversely affect paleontological resources. Implementation of mitigation measures Paleontology-1, Paleontology-2, and Paleontology-3 would reduce the potential for impacts to paleontological resources.

Operation and Maintenance

During operation and maintenance of the solar facility, no major ground disturbing activities or excavations would occur as part of routine maintenance, and impacts to paleontological resources would not occur.

Decommissioning

When the Project reaches the end of its operational life, the Project components could be decommissioned and dismantled. Since decommissioning activities would require the removal of existing structures, the ground disturbance associated with decommissioning would occur in areas previously disturbed during construction. Therefore, decommissioning would not impact additional paleontological resources.

Application of CEQA Significance Thresholds

PALEO-1) Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Grading and excavation during site preparation would have the potential to adversely impact significant nonrenewable paleontological resources that may be present within the boundaries of the solar facility. Known and unknown sensitivity of some of the formations and paleontological resources on the solar facility necessitates a conclusion that the impact is potentially significant. The potential for discovery of unknown significant paleontological resources exists throughout the Project area and therefore could not be avoided by reconfiguring the Project. The implementation of a Paleontological Mitigation Program/Plan (PMP) would minimize the impact of construction-related activities. With implementation of paleontological mitigation measures for known fossil sites and unknown subsurface fossil sites, potential adverse impacts on paleontological resources within the Project area during construction would be reduced to less than significant (refer to Mitigation Measure Paleontology-1).

Excavation activities associated with construction of the 230 kV gen-tie line on previously undisturbed lands managed by the BLM could result in direct impacts to paleontological resources, which would be considered potentially significant. These resources cannot feasibly be avoided because the potential is essentially the same throughout all proposed transmission corridors. Mitigation Measures Paleontology-1 through Paleontology-3 provide recommendations to reduce impacts to paleontological resources associated with the gen-tie line to a less than significant level.

Unauthorized collection of fossil materials, dislodging of fossils from their preserved environment, and/or physical damage of fossil specimens could also adversely affect paleontological resources. A pre-construction meeting to be held with key construction personnel to provide worker training regarding paleontological resource significance, visual

identification, and fossil discovery notification procedures is recommended (refer to Mitigation Measures Paleontology-2 and Paleontology-3).

No impacts to paleontological resources are anticipated during operation and maintenance activities; however, should discoveries of paleontological resources be made during the operation of the proposed Project, Mitigation Measures Paleontology-2 and Paleontology-3 would ensure that paleontological resources would be handled appropriately. Accordingly, the impact would be less than significant.

Decommissioning and restoration activities at the end of the Project life would be less likely to impact paleontological resources or unique geologic features since it is anticipated that any such resources or features would be identified during construction. Nevertheless, in order to avoid impacts to any resources that may not have been identified during construction and operation, decommissioning activities would be subject to a selected monitoring program (as specified in Mitigation Measure Paleontology-1), consistent with local, State, and federal laws and regulations applicable at the time of decommissioning.

Alternative 2: No Project Alternative

The No Project Alternative would avoid paleontological resources by eliminating all proposed construction, operations and maintenance, and decommissioning activities associated with the proposed Project, and no new direct or indirect impacts would occur.

Under the No Project Alternative, there would be no impacts to paleontological resources, since no construction or operations would occur. However, continued agricultural operations could result in disturbance to paleontological resources. Also, in the absence of this Project, other renewable energy projects may be constructed to meet State mandates at other locations, and those projects would likely have similar impacts as the proposed Project in those locations.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 is similar to Alternative 1, with the exception of the proposed location of the 230 kV gen-tie line. The Alternative 3 gen-tie line would be a few hundred feet north of the proposed 230 kV alignment and would have the same impact to paleontological resources as Alternative 1 with respect to construction in the Qpv geologic units. Implementation of mitigation measures Paleontology-1, Paleontology-2, and Paleontology-3 would reduce the potential for impacts to paleontological resources.

Application of CEQA Significance Thresholds

PALEO-1) Would Alternative 3 directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Alternative 3 is not expected to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, but the possibility of uncovering previously unknown resources presents a potentially significant impact. Implementation of Mitigation Measures Paleontology-1 through Paleontology-3 would reduce impacts to paleontological resources to a less than significant level.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Alternative 4 is similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. It would be approximately 0.8 mile south of the proposed 230 kV alignment and would have the same impact as Alternative 1 with respect to construction in the Qpv geologic units.

Application of CEQA Significance Thresholds

PALEO-1) Would Alternative 4 directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Alternative 4 would not directly or indirectly destroy a unique paleontological resource or site or unique geologic feature. Implementation of Mitigation Measures Paleontology-1 through Paleontology-3 would reduce impacts to paleontological resources to less than significant.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Similar to the proposed Project, 73 acres would be utilized for the 230 kV gen-tie line. In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building north of the I-10 freeway. Alternative 5 would have one access point (planned on Seeley Avenue); no access proposed for Riverside Drive. This Alternative would not be developed on land north of I-10. Instead, this Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility. Alternative 5 would avoid solar development north of I-10 and the existing agricultural operations would continue in this area (approximately 1,184 acres); therefore, no impacts would occur to the existing cultural resources located in this area.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but not within the City limits of Blythe in comparison to the proposed Project. Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The construction, operation, maintenance, and decommissioning of Alternative 5 would not exceed impacts to paleontological resources identified under the Alternative 1 analysis. Therefore, the Alternative 1 analysis would be applicable to Alternative 5, outside of those differences identified in the discussion below.

Analysis of Direct and Indirect Impacts

Construction

Refer to the analysis under Alternative 1. The Reduced Acreage Alternative would occur within the same limits as Alternative 1, with the exception of development north of I-10. However, there is a moderate potential for significant paleontological resources on the portions of the site underlain by the geologic unit Qpv. Any grading and excavation during site preparation and construction would have high potential to adversely affect significant nonrenewable paleontological resources that may be present within the boundaries of the solar facility.

Excavation activities associated with construction of the proposed 230 kV gen-tie line on previously undisturbed lands managed by the BLM could directly impact significant paleontological resources within the geologic rock unit Qpv, which has a moderate fossil yield potential (PFYC 3a). Excavations of 20 to 30 feet in depth would be required in association with gen-tie structure construction and could also result in direct impacts to paleontological resources within the sensitive geologic rock unit with a moderate fossil yield potential (PFYC 3a) on only those portions of the ROW overlying geologic unit Qpv.

Further, unauthorized collection of fossil materials, dislodging of fossils from their preserved environment, and/or physical damage of fossil specimens could also adversely affect paleontological resources.

Implementation of mitigation measures Paleontology-1, Paleontology-2, and Paleontology-3 would reduce the potential for impacts to paleontological resources.

Operation and Maintenance

During operation and maintenance of the solar facility, no major ground-disturbing activities or excavations would occur as part of routine maintenance, and impacts to paleontological resources would not occur.

Decommissioning

When Alternative 5 reaches the end of its operational life, the Alternative 5 components could be decommissioned and dismantled. Since decommissioning activities would require the removal of existing structures, the ground disturbance associated with decommissioning would occur in areas previously disturbed during construction. Therefore, decommissioning would not impact additional paleontological resources.

Application of CEQA Significance Thresholds

PALEO-1) Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Similar to Alternative 1, the potential for discovery of unknown significant paleontological resources exists throughout the Project area and therefore could not be avoided by reconfiguring Alternative 5. The implementation of a PMP would minimize the impact of construction-related activities. As such, the PALEO-1 analysis for Alternative 1 would apply.

Cumulative Impacts

Geographic Scope

Cultural and Paleontological Resources

The past, present, and reasonably foreseeable projects considered to be the cumulative scenario for this Project are listed in Table 4.1-1. The geographic extent of these projects in relation to the BMSP is shown in Figure 4.1-1, which includes a number of the large-scale renewable energy projects and related transmission lines in the Riverside SEZ and also includes some small-scale land development projects. Each of these projects would result in ground disturbance, primarily during Project construction; however, ground-disturbing activities during operation and maintenance and decommissioning could also affect paleontological resources.

Temporal Scope

Paleontological resources are non-renewable, any loss or physical damage to these resources is permanent. They would be subject to direct impacts primarily during Project construction; however, impacts could occur during any ground-disturbing activities during operation and maintenance and decommissioning. For purposes of the cumulative analysis, the temporal impact scope is the life of the Project.

Analysis of Direct and Indirect Impacts

Alternative 1: Proposed Project

Cumulative development in eastern Riverside County in the Palo Verde Mesa region of Southern California within paleontologically-sensitive geologic units such as older alluvial formation Qpv, have the potential to directly or indirectly impact paleontological resources. As discussed above, there is a potential

for paleontological resources on the Project solar facility site and gen-tie ROW to be impacted during construction of the proposed Project. However, with the implementation of mitigation measures Paleontology-1 through Paleontology-3, paleontological resource impacts (impact PALEO-1) would be reduced to less than significant. The proposed Project, as well as other development projects, would be evaluated for paleontological impacts and would necessarily include mitigation to protect resource values. Cumulative projects would also comply with regulations of the County of Riverside and the proposed guidelines of the Society of Vertebrate Paleontology. Therefore, the proposed Project would not adversely affect paleontological resources under NEPA or contribute to significant cumulative paleontological resource impacts under CEQA.

Alternative 2: No Project Alternative

The No Project Alternative would not contribute to any new paleontological resource effects; however, continuation of the status quo would include continued use of a majority of the Project area for agricultural purposes and continued potential for inadvertent effects on known resources. The public lands in the Project area would continue to be managed by BLM in accordance with existing land use designations in the CDCA Plan, whereas the private lands would continue to be managed for agricultural production. Alternative 2 would not contribute to cumulative paleontological resource impacts.

Alternative 3: Northern 230 kV Gen-tie Line Location

Construction, Operation and Maintenance, and Decommissioning

Cumulative development in eastern Riverside County in the Palo Verde Mesa region of Southern California that occur within paleo-sensitive geologic units such as older alluvial formations Qpv has the potential to directly or indirectly destroy paleontological resources. As discussed above, there is a potential for Alternative 3 to impact paleontological resources on the solar facility site and the gen-tie ROW. However, with the implementation of Mitigation Measures Paleontology-1 through Paleontology-3, paleontological resource impacts (impact PALEO-1) would be reduced to less than significant. Cumulative projects would be evaluated for paleontological impacts and would necessarily include mitigation to protect resource values. Cumulative projects would also comply with regulations of BLM, the County of Riverside, and the proposed guidelines of the Society of Vertebrate Paleontology. Therefore, the proposed Project would not adversely affect paleontological resources under NEPA or contribute to significant cumulative paleontological resource impacts under CEQA.

Alternative 4: Southern 230 kV Gen-tie Line Location

Paleontological Resources

Construction, Operation and Maintenance, and Decommissioning

Cumulative development in eastern Riverside County in the Palo Verde Mesa region of Southern California that occur within paleo-sensitive geologic units such as older alluvial formation Qpv has the potential to directly or indirectly destroy paleontological resources. As discussed above, Alternative 4 has the potential for paleontological resources on the solar facility site and the gen-tie ROW to be impacted during construction. However, with the implementation of Mitigation Measures Paleontology-1 through Paleontology-3, paleontological resource impacts (impact PALEO-1) would be reduced to less than significant. The cumulative projects would be evaluated for paleontological impacts and would necessarily include mitigation to protect resource values. Cumulative projects would also comply with regulations of BLM, the County of Riverside, and the proposed guidelines of the Society of Vertebrate Paleontology. Therefore, the proposed Project would not adversely affect paleontological resources under NEPA or contribute to significant cumulative paleontological resource impacts under CEQA.

Alternative 5: Reduced Acreage Alternative

Cumulative development in eastern Riverside County in the Palo Verde Mesa region of Southern California within paleo-sensitive geologic units such as older alluvial formation Qpv has the potential to

directly or indirectly destroy paleontological resources. As discussed above, there is a potential for paleontological resources on the Alternative 5 solar facility site and gen-tie ROW to be impacted during construction of Alternative 5. However, Similar to Alternative 1, with the implementation of Mitigation Measures Paleontology-1 through Paleontology-3, paleontological resource impacts (impact PALEO-1) would be reduced to less than significant. Other development projects would be evaluated for paleontological impacts and if potentially significant impacts are identified, would necessarily include mitigation to protect resource values. Cumulative projects would also comply with regulations of the County of Riverside and the proposed guidelines of the Society of Vertebrate Paleontology. Therefore, Alternative 5 would not adversely affect paleontological resources or contribute considerably to significant cumulative paleontological resource impacts.

Mitigation Measures

Paleontology-1 Prior to issuing any grading or excavation permits for activities within any area of the Project area, and prior to any Project-related ground-disturbing activities of that area, the Applicant shall implement procedures to monitor, avoid, and/or recover unique paleontological resources discovered during ground-disturbing activities. These procedures, the Paleontological Resources Monitoring and Mitigation Plan (PRMMP), shall be developed by a qualified vertebrate paleontologist and submitted for approval by the County of Riverside for private lands, and the BLM for BLM-managed lands. The PRMMP shall specify how mitigation measures Paleontology-1, Paleontology-2, and Paleontology-3 shall be implemented. This PRMMP shall be consistent with the provisions of CEQA, as well as with regulations currently implemented by the County of Riverside, the BLM and the proposed guidelines of the Society of Vertebrate Paleontology. The PMP shall include, but not be limited to:

1) A requirement that, during excavations in areas underlain by geologic units identified as having a high paleontologic sensitivity under Society of Vertebrate Paleontology guidelines (or a PFYC rating of 3b or higher) and likely to contain paleontologic resources, a qualified vertebrate paleontologist, who is a Registered Professional Geologist, shall direct the paleontologic monitoring by a qualified paleontologic monitor. Areas of concern include all previously undisturbed paleontologic sensitive sediments of the fossiliferous Pleistocene Palo Verde Mesa Alluvium.
2) A requirement that paleontologic monitors be equipped to salvage fossils as unearthed to avoid construction delays and to remove samples of sediments likely to contain the remains of small fossil invertebrates and vertebrates. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens.
3) Identification of the processes for preparation of recovered specimens to a point of identification. If the paleontologic monitor determines that the resource is unique, it shall be prepared for permanent preservation, including washing of sediments to recover small invertebrates and vertebrates.
4) A requirement that a report be prepared documenting all finds with permanent retrievable paleontologic storage for curation of specimens. The paleontologist should have a written repository agreement in hand prior to the initiation of mitigation activities. Mitigation of adverse impacts to unique paleontologic resources is not complete until such curation into an established museum repository has been fully completed and documented.
5) A requirement that a report be prepared documenting all finds with an appended itemized inventory of specimens. The report and inventory, when submitted to the County with respect to private lands, and to the BLM with respect to BLM-managed lands, along with confirmation of the curation of recovered unique paleontological specimens into an established, accredited museum repository, would signify completion of the PMP to mitigate impacts to paleontologic resources.

AR072433

Paleontology-2 Prior to issuance of the first grading permit, a worker training program shall be prepared and include information on the recognition of the types of paleontological resources that could be encountered within the Project area and referral of finds to the paleontologic monitor if they are found. This information shall be presented to Project construction personnel and Project operation and maintenance personnel by a qualified professional paleontologist.

Paleontology-3 If construction or other Project personnel discover any potential fossils during construction, operation and maintenance, or decommissioning, the fossils shall be left undisturbed and the paleontological monitor shall be notified immediately and shall then take appropriate actions to evaluate the find in accordance with the PMP.

Residual Impacts After Mitigation

Implementation of BMPs and Mitigation Measures Paleontology-1 through Paleontology-3 would, under both NEPA and CEQA, minimize potential impacts to paleontological resources and would reduce the impacts, including cumulative impacts, to less than significant.

NEPA Conclusions

The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged. The Project and each of the action Alternatives would have the direct and indirect impacts and contribution toward cumulative impacts that are described above. Each would comply with applicable plans and laws, and the BMPs and Mitigation Measures described above, and would not result in significant adverse impacts.

4.2.13 Population, Housing, Public Services, Utilities, and Socioeconomics

This section analyzes the effects of the proposed Project and Alternatives related to population, housing, public services, utilities and socioeconomics, and describes the methods used to determine the effects of the proposed Project and Alternatives.

Methodology for Analysis

To determine how the proposed Project would induce population growth, the availability of the local workforce and population in the region was analyzed.

Physical impacts to public services are usually associated with population in-migration and growth in an area, which increase the demand for a particular service, leading to the need for expanded or new facilities. Public service providers serving the solar facility would be within Riverside County and the City of Blythe only and represent the local study area. Therefore, the study area for the public services analysis is limited to Riverside County and the City of Blythe. Construction is anticipated to occur over a three-year period, of which peak construction would occur over two years and require a workforce of approximately 300 to 500 daily workers present throughout the Project area.

The analysis of the impacts of the Project and Alternatives on environmental justice issues follows guidelines described in the CEQ's Environmental Justice Guidance under NEPA (CEQ 1997). To determine whether an adverse and significant impact has issues in environmental justice, the approach to the analysis considers two factors: 1) assessment of whether impacts associated with construction and operation of the proposed Project would result in a high potential for adverse environmental impacts; and 2) for impacts that are high and adverse, determination as to whether these impacts would disproportionately affect minority and low-income populations.

The purpose of this analysis, pursuant to Executive Order 12898, is to identify and address whether high and adverse human health or environmental effects are likely to fall disproportionately on minority and/or low-income populations of the community. Pursuant to the directive, the EPA issued guidelines that require all federal and state agencies receiving federal funds to develop strategies to address this issue. This analysis uses the federal guidelines to analyze potential environmental justice impacts. Federal guidelines for addressing environmental justice include a two-step screening process to determine whether a project could result in disproportionate impacts on low-income and minority populations. The first step is to evaluate whether the potentially affected community or area includes minority and low-income populations. If it contains these population groups, the second step is to determine whether the environmental impacts fall disproportionately on minority and low-income members of the community. The CEQ and the EPA use a 50 percent concentration of minorities or people with low-income as a cutoff to indicate that there is a potential issue in a given area.

CEQA Significance Criteria

The criteria used to determine the significance of the Project-related socioeconomic impacts are based on the criteria identified in the CEQA Guidelines, Appendix G. Project-related impacts would be considered significant if they:

SOC-1) Induce substantial population growth in an area, either directly or indirectly.

SOC-2) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere.

SOC-3) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

PS-1) Result in substantial adverse physical impacts associated with the provision of new or physically altered facilities to provide public services.

USS-1) Result in substantial adverse environmental impacts associated with the provision of utility services. Substantial adverse environmental impacts may occur if the Project would:

a. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board.

b. Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

c. Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

d. Have insufficient water supplies available to serve the project from existing entitlements and resources, or require new or expanded entitlements.

e. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

f. Be served by a landfill within insufficient permitted capacity to accommodate the project's solid waste disposal needs.

g. Fail to comply with federal, state, and local statutes and regulations related to solid waste.

The following additional significance criteria from the County of Riverside Environmental Assessment form are used in the analysis. A project could have potentially significant impacts if it would:

SOC-4) Create a demand for additional housing, particularly housing affordable to households earning 80% or less of the County's median income.

SOC-5) Affect a County Redevelopment Project Area.

SOC-6) Cumulatively exceed official regional or local population projections.

USS-2) Impact the following facilities requiring or resulting in the construction of new facilities or the expansion of existing facilities, the construction of which could cause significant environmental effects.

a. Electricity

b. Natural gas

c. Communications systems

d. Storm water drainage

e. Street lighting

f. Maintenance of public facilities, including roads

g. Other government services

USS-3) Conflict with any adopted energy conservation plans.

NEPA Requirements

According to NEPA, an EA must evaluate social and economic effects of a project if they are related to effects on the natural or physical environment.

Executive Order 12898 requires a proposed project's impacts on Environmental Justice be considered as part of the NEPA Process if a project would:

- Result in adverse effects or impacts that are appreciably more severe in magnitude or are predominantly borne by any segment of the population, for example, household population with low income or a minority population in comparison with a population that is not low income or minority.

Pursuant to NEPA, this analysis is intended to compare the Alternatives and identify any adverse effects to socioeconomic and environmental justice that cannot be avoided. Adverse effects may be direct, indirect, or cumulative. Potential direct and indirect effects of the proposed Project and Alternatives are analyzed below and discussed as construction-related, operation- and maintenance-related, and decommissioning effects.

Applicable Best Management Practices

As part of the Project and Alternatives, the following applicable BMPs would minimize the environmental impacts to public services and utilities. The full BMPs have been detailed below (see also Table 2-4 in Chapter 2) and are further referenced (by number) within the impact discussion.

NUMBER	BMP DESCRIPTION
BMP-1	**Drainage, Erosion, and Sedimentation Control Plan**. As part of the County of Riverside's Conditional Use Permit (CUP) requirements, a Drainage, Erosion, and Sedimentation Control Plan would be developed for the Project. The plan would address the drainage, erosion, and sediment control requirements to support all activities associated with construction, operation, maintenance, and decommissioning of the Project. For example, any stockpiles created would be kept on-site, with an upslope barrier in place to divert runoff. Stockpiles would be sprayed with water, covered with tarpaulins, and/or treated with appropriate dust suppressants, especially in preparation for high wind or storm conditions. Certified weed-free straw bale barriers would be installed to control sediment in runoff water; straw bale barriers would be installed only where sediment-laden water can pond, thus allowing the sediment to settle out. Topsoil from the site would be stripped, stockpiled, and stabilized before excavating earth for facility construction. Topsoil would be segregated and spread on freshly disturbed areas to reduce color contrast and aid rapid revegetation.
BMP-2	**Stormwater Pollution Prevention Plan.** In compliance with requirements of the National Pollutant Discharge Elimination System (NPDES) permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and prepared for the Project to ensure that protection of water quality and soil resources is consistent with County and State regulations. The plan would identify site surface water runoff patterns and include measures that prevent excessive and unnatural soil deposition and erosion throughout and downslope of the Project area and Project-related construction areas, and would also include measures for non-stormwater discharge and waste management. The SWPPP would cover all activities associated with the construction of the Project, including clearing, grading, and other ground disturbance such as stockpiling or excavation erosion control. The plan would prevent off-site migration of contaminated stormwater, changes in pre-Project storm hydrographs, or increased soil erosion.
BMP-4	**Fire Management and Protection Plan.** As required by existing law (Title 8 California Code of Regulations [CCR] Section 3221), a Fire Management and Protection Plan would be developed in consultation with the Riverside County Fire Department to identify potential hazards and accident scenarios that would exist at the facility during construction, operation, maintenance, and decommissioning of the Project. The Plan would include the identification of the following: potential fire hazards and ignition sources; proper handling and storage of potential fire hazards; control of potential ignition sources; persons responsible for equipment and systems maintenance; location of portable fire extinguishers; automatic sprinkler fire suppression system; water-spray fire system; coordination with local fire department; and recordkeeping requirements.
BMP-11	**Project structures, gen tie line, and building surfaces.** Project facilities would be sited to ensure that there is adequate space (i.e., setbacks of no less than 100 feet) between solar facilities and natural washes. These setbacks would preserve and maintain the natural washes' hydrological functions. The color and finish of Project structure and building surfaces that are visible to the public will be designed to ensure minimal visual intrusion, contrast, and glare. Grouped structures will be painted the same color to reduce visual complexity and color contrast. Solar panel backs will be color-treated to reduce visual contrast with the landscape setting. Materials, coatings, or paints having little or no reflectivity will be used wherever possible. The visual color contrast of graveled surfaces will be reduced with approved color treatment practices.

NUMBER	BMP DESCRIPTION
BMP-13	**Ground and surface disturbance.** Construction boundaries would be clearly delineated to minimize areas of ground and surface disturbance. Ground-disturbing activities shall be minimized, especially during the rainy season. To the maximum extent possible, construction-related activities (such as vehicle and foot traffic) would avoid areas with intact biological soil crusts. For cases in which impacts cannot be avoided, soil crusts would be salvaged and restored on the basis of recommendations by the County of Riverside and BLM once construction has been completed. Existing rocks, vegetation, and drainage patterns shall be preserved to the maximum extent possible. No paint or permanent discoloring agents shall be applied to rocks or vegetation (to indicate surveyor construction activity limits or for any other purpose). All stakes and flagging shall be removed from the construction area and disposed of in an approved facility. Where feasible, brush-beating, mowing, or use of protective surface matting rather than removing vegetation shall be employed. Clearing and disturbing of sensitive areas (e.g., steep slopes and natural drainages) and other areas shall be avoided outside the construction zone. Surface disturbance would be minimized by utilizing undulating surface disturbance edges; stripping, salvaging, and replacing topsoil; using contoured grading; controlling erosion; using dust suppression techniques; and restoring exposed soils to their original contour and vegetation.
BMP-14	**Travel and traffic.** Vehicular traffic on-site shall be confined to existing or designated travel routes and designated work areas. Access to the construction site and staging areas shall be limited to authorized vehicles and only through the designated roads. The extent of habitat disturbance during construction shall be reduced by keeping vehicles on access roads and minimizing foot and vehicle traffic through undisturbed areas. To the extent practical, travel shall be limited to stabilized roads. Road maintenance activities shall avoid blading existing forbs and grasses in ditches and adjacent to roads. Abandoned roads and roads no longer needed shall be subsoiled to increase infiltration and reduce soil compaction, then recontoured and revegetated. Construction traffic shall avoid unpaved surfaces to the extent practical (to reduce the risk of compaction) and reduce speed to lessen fugitive dust emissions. On unpaved or unstabilized surfaces within the construction site, speed limits (e.g., 20 mph) shall be posted with visible signs and enforced to minimize airborne fugitive dust. Project vehicle speeds shall be limited in areas occupied by special-status animal species. Traffic shall stop to allow wildlife to cross roads. Shuttle vans or carpooling shall be used to reduce the amount of traffic on access roads. Workers shall be trained to comply with the speed limit, use good engineering practices, minimize the drop height of materials, and minimize the number and extent of disturbed areas. The Project developer shall enforce these requirements.
BMP-15	**New access roads and parking lots.** New access roads shall be designed and constructed to the appropriate road design standards, such as those described in BLM Manual 9113 or County standards, whichever is applicable. New access roads shall be designed to follow natural land contours in the Project area and avoid existing desert washes. The specifications and codes developed by the U.S. Department of Transportation (DOT) and County of Riverside Transportation Department are also to be taken into account. Primary access roads and parking lots shall be surfaced with aggregate that is hard enough that vehicles cannot crush it and thus cause dust or compacted soil conditions. Paving may also be used on access roads and parking lots. Alternatively, chemical dust suppressants or durable polymeric soil stabilizers would be used on these locations.
BMP-20	**Waste Recycling Plan**. Prior to issuance of a grading and building permit, A Waster Recycling Plan shall be submitted to the Riverside County Water Management Department for approval. The plan shall identify: materials (i.e., cardboard, concrete, asphalt, wood) that will be generated by construction and development; projected amounts of materials; measures/methods that will be taken to recycle, reuse, and/or reduce the amount of materials; the facilities and/or haulers; and the target recycling or reduction rate. During Project construction, the construction site shall have, at a minimum, two bins: one for waste disposal and the other for recycling of construction and demolition materials. An accurate record keeping system of recycling construction and demolition recyclable materials and solid waste disposal shall also be established.

Alternative 1: Proposed Project

Analysis of Direct and Indirect Impacts

Construction

Population and Housing

Implementation of the Project would require the removal of three residences within the Project area that are associated with the existing agricultural operations. These residents would likely relocate to vacant housing in the Blythe/Palo Verde Valley region.

Given the location of the Project area in eastern Riverside County, it is likely that most of the construction workforce would be derived from communities located within Riverside County, which has the largest concentration of construction workers in proximity to the Project area (refer to Table 3.2.12-4 and 3.2.14-5). The majority of the projected construction workforce would likely seek housing closer to the Project area (within an hour driving distance) or seek temporary housing (such as seasonal, recreational, or occasional use housing; long-term visitor areas; and hotel and motels) during the week and commute home over the weekend. During construction, the Project would temporarily increase the local population.

If construction workers stay in the Project area temporarily, it could affect the supply of temporary accommodations and rental housing nearest the local area, especially during the two-year peak construction period. As indicated in Table 3.2.13-3, *Study Area Housing Characteristics,* vacancy rates for housing throughout the study area are high, which range from 12 to 60 percent. The vacancy rates for Blythe Census County Division, Riverside County, Imperial County, and La Paz County are: 17 percent, 14 percent, and 12 percent respectively. There is sufficient housing to accommodate the Project's construction workforce.

Should construction workers drawn from beyond an hour commute require temporary housing accommodations closer to the Project area during the course of the construction period, or portion thereof, 14 hotels and motels with a total of 789 rooms were identified within an hour commute to the Project area. In addition, as described in Section 3.2.14, *Recreation,* the Midland LTVA and Mule Mountains LTVA provide long-term camping opportunities in the vicinity of the Project area. There are a sufficient number of hotels, motels, and long-term camping options to accommodate the Project's construction workforce. The Project would not induce substantial permanent growth to the regional population levels.

During construction, and for a shorter period of time during decommissioning, there would be a temporary increase in population that may utilize existing neighborhood or regional parks or other recreational facilities in the Project vicinity. Long-term camping areas in particular may experience physical deterioration of the facilities. However, the long-term camping areas are designed with minimal facilities given that campers must use self-contained RVs and there are no assigned or designated sites.

Economy and Employment

While Project construction has the potential to increase demand on local housing, it would alternatively have beneficial effects on the local economy, especially to hotels, motels, and rental housing, as vacant rooms would likely be filled.

Fiscal Resources

The construction phase of the Project is expected to have positive financial impacts through increased sales tax revenue.

Environmental Justice

The Project could potentially affect minority populations in census tracts 461.02 and 462, as the proportion of minority residents in those tracts exceeds 50 percent. Consequently, it is conservatively judged that Census tracts 461.02 and 462 represent two communities of concern for environmental justice effects. Census tracts 461.02 and 462 have a higher proportion of minority residents than that of the general population of the nearest community (Blythe).

Table 3.2.13-13 lists the census tracts within a six-mile radius of the solar facility living below the poverty line; there are no populations that exceed the 50 percent threshold. While the proportion of low-income residents does not exceed 50 percent, 23 percent of tract 459, 26 percent of tract 461.02, and 21 percent of tract 469 were living below the poverty line, according to the 2010 census. These represent percentages that are meaningfully greater than the nearby City of Blythe; 16 percent of tract 462 was also living below the poverty line, which is meaningfully greater than Riverside County. Census tracts 459, 461.02, and 469 could represent communities of concern for environmental justice effects based on persons living below the poverty line, as their percentages are meaningfully greater than the percentage of the population living below the poverty line in the City of Blythe, along with tract 462, compared to the County of Riverside.

In the context of constructing a solar facility, the primary environmental justice issues typically would be potential air or water issues that could adversely affect the health of nearby populations. Other issues could be any potential residential or business displacements and noise effects on populations near the solar facility or ancillary facilities. However, the Project would not result in significant air quality effects or effects to surrounding communities from emissions of toxic air contaminants. The Project would not involve wastewater discharges that could affect drinking water supplies or other water bodies.

As shown in Chapter 3, Figure 3.2.1-1, *Residences within One Mile of the Proposed Project*, three residences associated with the existing agricultural operation would be removed as part of this Project. However, the Project would not be within an existing residential community, and would not displace nearby residences.

Public Services

The construction workforce would temporarily increase the local population, but would not require construction or alteration of physical facilities to provide adequate education, law enforcement, parks and recreation, and hospital facilities and emergency response services.

The proposed Project would represent a land use change for the area from agricultural fields and vacant lands to a solar facility site and gen-tie lines. The operational capabilities to handle technical rescues at electrical facilities, such as confined space/trench rescue/high angle rescue, may require increased staffing, training, and equipment. New or upgraded fire facilities may be required in order to accommodate additional staffing and fire rescue apparatus for solar facilities. Specialized rescue equipment may also be required in order to service the proposed gen-tie lines, which will require proper storage and maintenance to ensure optimal performance in the event of an emergency.

Education

The majority of the projected construction workforce would likely seek housing closer to the Project area (within an hour-hour driving distance) or seek temporary housing during the week and commute home over the weekend. It would be unlikely that construction workers would relocate close to the Project area with their families due to the temporary nature of the construction period. Therefore, the temporary addition of construction workers to the Project area's population is not anticipated to increase school enrollment. No impact would occur and no mitigation recommended.

Law Enforcement

The temporary increase of construction workers could increase demands on police services. However, during construction, on-site security would include trained, uniformed, and unarmed personnel whose primary responsibility would be to control ingress and egress of personnel and vehicles, perform fire and security watch during off hours, and perform security badge administration, all of which would minimize the potential need for the City of Blythe Police Department's and the Riverside County Sheriff's Department assistance. The construction workforce is expected to be hired generally from within the available regional workforce.

Because Project construction is not anticipated to increase the local population, no new or expanded law enforcement facilities or increased staff levels within the Project regional or local study area would be required. Construction of the BMSP would generate truck and employee traffic along haul routes and at the Project area, which could temporarily increase the accident potential in these areas over the short-term construction period. However, the additional volume of traffic associated with workers commuting to the sites during construction would be temporary and it is anticipated that personnel and equipment from the City and the California Highway Patrol (CHP) would be sufficient to respond to incidents in the Project area. Project construction is not expected to adversely affect the CHP's ability to patrol the highways.

Fire Protection

During construction, there is the potential for both small fires and major structural fires. Electrical sparks, combustion of fuel oil, hydraulic fluid, mineral oil, or insulating fluid at substations, or flammable liquids, explosions, and over-heated equipment may cause small fires. The Project would result in an increase in demand for fire protection services over existing levels during construction. The proposed Project would represent a land use change for the area from agricultural fields and vacant lands to a solar facility site and gen-tie lines. The operational capabilities to handle technical rescues at electrical facilities, such as confined space/trench rescue/high angle rescue, may require increased staffing, training, and equipment. New or upgraded fire facilities may be required in order to accommodate additional staffing and fire rescue apparatus for solar facilities. Specialized rescue equipment may also be required in order to service the proposed gen-tie lines, which will require proper storage and maintenance to ensure optimal performance in the event of an emergency.

The Project area is located within the service area of the RCFD and City of Blythe Volunteer Fire Department. Based on the proposed Project's proximity to the nearest station (Station #45, Blythe Air Base, 17280 W. Hobson Way, Blythe, CA 92225), it falls within acceptable Total Response Time policy standards for an 'outlying' land use area and meets the seventeen minute and 30 second response time standard. Additionally, the solar facility site is approximately five miles away from the City of Blythe Volunteer Fire Department (210 North Commercial Street, Blythe, CA 92225).

Pursuant to Riverside County Ordinance 659, the Applicant would be required to pay a development impact fee for fire services "in order for the County to construction or acquire the needed facilities" (Riverside County 2006). If facilities are constructed or acquired using funds provided by the Project or if new or physically altered fire protection facilities are paid for with the money, the construction of such facilities could cause significant environmental impacts indirectly attributable to the Project. However, the location, size, nature, and other details of such facilities, if needed, or the environmental effects of their construction or alternation are not yet known. Because too little is known about whether, and if so what, facilities would be constructed with Project-related fees, any impact analysis and attempt to reach conclusions about the environmental effects they could cause would be speculative.

Parks and Recreation

As discussed above, the required construction workforce of the Project is expected to be hired generally from the available regional workforce. There would be temporary in-migration that would increase the local population during construction; however, it would not warrant the need for new or expanded parks and recreational facilities or staff levels within the Project regional or local study area.

Hospital Facilities and Emergency Response

In the event of an on-site accident during Project construction, the RCFD would provide first responder emergency medical care. The nearest RCFD fire stations are staffed full-time, 24 hours, 7 days a week, with a minimum three-person crew, including paramedics. Once a patient is transported, a number of local area hospitals are available to provide emergency medical care. While a high number of construction employees would be located on-site, local area emergency medical facilities are expected to adequately handle any worksite accidents requiring their attention. Minor injuries could be treated at Palo Verde Hospital in Blythe, California or La Paz Medical Services in Quartzsite, Arizona. Injuries resulting in significant trauma would be treated at the Desert Regional Medical Center (Cox 2011) in Palm Springs, California. Project construction would not require new or expanded hospital facilities or personnel or result in the increase in emergency responder staff levels within the Project regional or local study area.

Utilities

Project construction would not result in significant adverse demands on natural gas, electricity, water, sewer, or solid waste facilities.

Electricity and Natural Gas

Electricity within the vicinity of the Project area is provided by SCE. The Project would temporarily increase the population during construction. However, it is anticipated that construction workers would utilize existing housing (permanent and temporary) that is available in the study area; therefore, no new or expanded electrical and natural gas systems would be required. The Project would not induce substantial growth to the regional population levels; as such, demands on the electrical and natural gas systems would be nominal and there would be no need to alter these existing facilities in response.

The power produced by the Project would be conveyed to the local power grid via interconnection to the SCE Colorado River Substation, an approved new substation south of I-10 and west of the Project area boundary. The BMSP would use generators during the initial construction phase to supply electrical needs. The Project would not involve use of natural gas service. The Project would not involve communication systems, nor would it require new or expanded communication facilities. As such, current electrical and natural gas facilities could handle the demands of Project development and operation; thus, no new or altered facilities would be needed.

Water and Wastewater

Project development would not require construction or expansion of public water treatment and/or service systems or additional entitlements or resources. The Project would have limited water needs during construction (i.e., for dust suppression and other construction needs) and operation (for maintenance needs). While water would be utilized during Project construction activities, the construction of new or expansion of existing, public water facilities would not be required. Restroom facilities during Project construction would be provided by portable units to be serviced by licensed providers. The Project would not exceed wastewater treatment requirements during construction because the Project would not be connected to a public sewer system.

Solid Waste

Restroom facilities during Project construction would be provided by portable units to be serviced by licensed providers. Solid waste would include recyclable materials such as metals and plastics, as well as various construction materials and worker-generated waste that would include a combination of recyclable and non-recyclable materials. To the extent practicable, waste generated during construction and operation would be recycled. The non-recyclable, non-hazardous solid waste materials would be land filled in accordance with State and local regulations.

The Blythe landfill, which is closest to the Project area, has sufficient capacity to continue to provide solid waste disposal through 2047. Therefore, sufficient capacity is anticipated to be available for waste

disposal. The Project would comply with applicable federal, State, and local regulations related to solid waste.

Operation and Maintenance

Operation of the solar facility is expected to require approximately 12 permanent full-time employees, which would not be considered a substantial demand on the Project area's workforce.

Population and Housing

As shown in Figure 3.2.1-1, *Residences within One Mile of the Proposed Project* in Chapter 3, three residences exist within the solar facility Project boundary and would be removed as a result of Project implementation. While removal of these residences during construction of the proposed Project would result in the displacement of residential households, displacement and the removal of the three residences would not be substantial enough to warrant replacement housing.

Economy and Employment

Operation of the proposed Project would have positive impacts on the local economy through the creation of local employment opportunities and through local expenditures for supplies and services. In addition to the jobs directly related to operation of the Project, additional indirect and induced jobs would be provided by operation of the Project. These impacts would occur in Riverside County on an annual basis for the duration of Project operation.

Fiscal Resources

The Riverside County Assessor's Office would have jurisdiction over the valuation of the Project for property tax purposes. The Project would qualify for the exclusion of certain parts from valuation per the Revenue and Taxation Code, Section 73. Riverside County would start realizing annual property tax revenue once construction of the Project is complete.

The BLM has issued a policy by which it would determine the value of the lease for the gen-tie portion of the Project on its lands following approval of the Project.

Environmental Justice

Operation and maintenance activities would not adversely affect any particular population, including minority or low-income populations. The Project would not result in significant air quality impacts or impacts to surrounding communities from emissions of toxic air contaminants. The Project would not involve wastewater discharges that could affect drinking water supplies or other water bodies during operation and maintenance activities. As such, there would be no direct or indirect adverse health or environmental effects associated with operations and maintenance activities.

Public Services

Due to the temporary nature of Project construction activities, it is unlikely that construction workers would permanently relocate closer to the solar facility with their families. Additionally, operation of the Project would require a nominal workforce and is not anticipated to increase the local population. Therefore, the Project would not make significant demands on education, law enforcement, fire protection, parks and recreation, and hospital facilities and emergency response.

Fire Protection

During operations, the O&M buildings would include their own emergency power, fire suppression, and potable water systems. As part of the Project, implementation of BMP-4, Fire Management and Protection Plan, would ensure that emergency fire precautions are employed during Project construction.

The proposed Project would represent a land use change for the area from agricultural fields and vacant lands to a solar facility site and gen-tie lines. The operational capabilities to handle technical rescues at electrical facilities, such as confined space/trench rescue/high angle rescue, may require increased staffing, training, and equipment. New or upgraded fire facilities may be required in order to accommodate additional staffing and fire rescue apparatus for solar facilities. Specialized rescue equipment may also be required in order to service the proposed gen-tie lines, which will require proper storage and maintenance to ensure optimal performance in the event of an emergency.

Utilities

Operation of the Project would not result in substantial adverse demands on natural gas, electricity, water, and sewer facilities.

Electricity and Natural Gas

The power produced by the Project would be conveyed to the local power grid via interconnection to the SCE Colorado River Substation, an approved new substation south of I-10 and approximately 6.5 miles west of the Project area boundary. During operation, the solar facility's electrical needs would be supplied internally. The Project would not involve use of natural gas service. The Project would not involve communication systems, nor would it require new or expanded communication facilities. As such, current electrical and natural gas facilities could handle the demands of Project development and operation; thus, no new or altered facilities would be needed.

Water and Wastewater

The Project would have limited water needs during operation (for maintenance needs). During operation and maintenance, drinking water and process water would be supplied by the PVID. While water would be utilized during operation, construction of new or expansion of existing public water facilities would not be required. The O&M buildings would generate a minimum volume of wastewater as result of daily activities. Wastewater would be treated via a septic system permitted through the Riverside County Department of Environmental Health Services, and would be in compliance with Department requirements. The Project would not exceed wastewater treatment requirements during construction, operation, maintenance, and decommissioning because the Project would not be connected to a public sewer system.

Solid Waste

Restroom facilities would be provided in the O&M buildings and would be served by a private septic system to be developed on-site. The Project would generate solid waste during operation and maintenance. Solid waste would include recyclable materials such as metals and plastics, as well as various construction materials and worker-generated waste that would include a combination of recyclable and non-recyclable materials. To the extent practicable, waste generated during operation would be recycled. The non-recyclable, non-hazardous solid waste materials would be land filled in accordance with State and local regulations.

The Blythe landfill, which is closest to the Project area, has sufficient capacity to continue to provide solid waste disposal through 2047. Therefore, sufficient capacity is anticipated to be available for waste disposal. The Project would comply with applicable federal, State, and local regulations related to solid waste.

Decommissioning

Decommissioning of the proposed Project would require removal of the solar equipment and facilities and transportation of all components off-site. Equipment used for decommissioning would generally be similar to that used for construction; however, it is anticipated that the overall activity necessary during decommissioning would be much less than that of construction, and would not result in an increased need for fire and police protection services or other public services. As discussed above, temporary in-

migration would occur; however, it would not warrant the need for new or physically altered governmental facilities, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services. Decommissioning activities would not adversely affect any particular population, including minority or low-income populations. The Project would not result in significant air quality impacts or impacts to surrounding communities from emissions of toxic air contaminants. The Project would not involve wastewater discharges that could affect drinking water supplies or other water bodies during decommissioning activities. As such, there would be no direct or indirect adverse health or environmental or effects associated with decommissioning activities.

Application of CEQA Significance Thresholds

SOC-1) Would the Project induce substantial population growth in an area, either directly or indirectly?

Proposed Project construction would temporarily increase population growth in the area; however, it would not be substantial. As discussed above, the required construction and operational workforce is not projected to trigger the need for new housing. As illustrated in Table 3.2.13-3, vacancy rates in the population and housing study area are high (12 to 60 percent), which include seasonal, recreational, and occasional use units. Additionally, within an hour commute, there are a high number of seasonal, recreational, or occasional use housing units (vacancy rates one to 43 percent) and transient lodging opportunities to serve construction employees. Furthermore, vacancy rates within the study area offer ample available housing to operational employees wishing to relocate within the local study area. Therefore, no significant construction- or operation-related impacts are expected for the study area housing supply, availability, or demand. The Project would not displace populations or existing housing, and it would not necessitate construction of replacement housing elsewhere; impacts would be less than significant.

SOC-2) Would the Project displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

While the proposed Project would displace three existing residences (two residences on APN 863060015 and one residence on APN 863100016) within the Project area, there is available housing within the Project area to relocate these residents elsewhere in the vicinity of the Project. Implementation of the proposed Project would not require the construction of replacement housing elsewhere. Impacts to existing housing as a result of Project implementation would be less than significant; no mitigation is recommended.

SOC-3) Would the Project displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

The proposed Project would not displace substantial numbers of people, necessitating the construction of replacement housing elsewhere. No impacts would occur.

SOC-4) Would the Project create a demand for additional housing, particularly housing affordable to households earning 80% or less of the County's median income?

The proposed Project would not contain a residential component that would result in a permanent increase in the population. The proposed Project would temporarily increase demand for housing; however, vacancy rates are high for local communities in close proximity to the Project area. Due to the temporary nature of Project construction activities, it is unlikely that construction workers would permanently relocate closer to the Project area with their families. Operation of the Project would require a nominal workforce and is not anticipated to increase the local population. Therefore, the Project would not create a demand for additional housing. Less than significant impacts would occur; no mitigation measure recommended.

SOC-5) Would the Project affect a County Redevelopment Project Area?

The Project area and immediate vicinity would not be within a former County Redevelopment Project Area. No impact would occur and no mitigation is recommended.

SOC-6) Would the Project cumulatively exceed official regional or local population projections?

See SOC-4 above. The proposed Project would temporarily increase the population during construction; however, it would not include housing and would require a nominal operational workforce. The proposed Project would not permanently increase the local population, nor would it cumulatively exceed regional or local population projections. Impacts would be less than significant.

PS-1) Would the Project result in substantial adverse physical impacts associated with the provision of public services?

The Project's construction workforce would increase the local population temporarily, but would not result in significant demands on public services, such as education, law enforcement, fire protection, parks and recreation, and hospital facilities and emergency response. The Project would not result in substantial adverse physical impacts associated with the provision of public services.

As previously described, the majority of the projected construction workforce would likely seek housing closer to the Project area (within an hour driving distance) or seek temporary housing (such as seasonal, recreational, or occasional use housing; long-term visitor areas; and hotel and motels) during the week and commute home over the weekend. It would be unlikely that construction workers would relocate close to the Project area with their families due to the temporary nature of the construction period. Therefore, the temporary addition of construction workers to the Project area's population is not anticipated to increase school enrollment that could result in adverse physical impacts associated with the provision of school facilities. No impact would occur and no mitigation recommended.

As previously noted, construction of the Project could increase demands on police services. However, during construction, on-site security would be present, which would minimize the potential need for the City of Blythe Police Department's and the Riverside County Sheriff's Department's assistance. Because Project construction is not anticipated to permanently increase the local population, no new or expanded law enforcement facilities or increased staff levels within the Project regional or local study area would be required, nor would Project development result in substantial adverse physical impacts on law enforcement facilities.

During construction, there is the potential for both small fires and major structural fires. The Project would result in an increase in demand for fire protection services over existing levels during construction. However, it is anticipated that personnel and equipment from the City of Blythe Volunteer Fire Department, the RCFD, and the California Department of Forestry and Fire Protection (CAL FIRE) would be sufficient to respond to a fire at the Project area because the O&M buildings would include their own emergency power, fire suppression, and potable water systems. After the construction phase, the proposed Project would include emergency access and other safety features and plans for fire protection. The access roads within the solar facility site would be constructed in accordance with current adopted codes and standards by the RCFD. The fire suppression system will be installed in the O&M buildings and shall be in accordance with current adopted codes and standards established by the RCFD. Therefore, adverse physical impacts to fire protection services during construction and operation are considered to be less than significant and no mitigation is recommended.

There would be temporary in-migration that would increase the local population; however, it would not warrant the need for new or expanded parks and recreational facilities or staff levels within the Project regional or local study area. No physical adverse impacts would result to parks and recreational facilities and no mitigation is recommended.

While a high number of construction employees would be located on-site, local area emergency medical facilities are expected to adequately handle any worksite accidents requiring their attention. Minor injuries could be treated at Palo Verde Hospital in Blythe, California or La Paz Medical Services in Quartzsite, Arizona. Injuries resulting in significant trauma would be treated at the Desert Regional Medical Center (Cox 2011) in Palm Springs, California. Project construction would not result in adverse physical impacts to hospital facilities within the Project regional or local study area. No impact would occur and no mitigation recommended.

The Project would not make significant physical demands on education, law enforcement, fire protection, parks and recreation, and hospital facilities. The proposed Project would not eliminate any lands designated for recreational use. No physical impacts associated with the provision of parks and recreational facilities would occur and no mitigation is recommended. Operation of the Project would not result in physical adverse impacts on medical facilities in the area because minor injuries could be treated at Palo Verde Hospital in Blythe, California or La Paz Medical Services in Quartzsite, Arizona. Injuries resulting in significant trauma would be treated at the Desert Regional Medical Center in Palm Springs, California, which is approximately one hour and twenty minutes by Medevac (Cox 2011). No impact would occur and no mitigation is recommended.

USS-1) Would the Project result in substantial adverse environmental impacts associated with the provision of utility services?

The Project would not result in substantial adverse environmental impacts associated with the provision of utility services. The majority of the projected construction workforce would likely seek housing closer to the Project area (within an hour-hour driving distance) or seek temporary housing (such as seasonal, recreational, or occasional use housing; long-term visitor areas; and hotel and motels) during the week and commute home over the weekend. The Project would not induce substantial growth to the regional population levels. As such, there would be nominal demands on the existing facilities related to: electrical and natural gas systems; water and wastewater systems: solid waste; and drainage facilities. There would be no need to alter these existing facilities.

Electricity and Natural Gas

The BMSP would use generators during the initial construction phase to supply electrical needs. The Project would not involve use of natural gas service. The Project would not involve communication systems, nor would it require new or expanded communication facilities. As such, current electrical and natural gas facilities could handle the demands of Project development and operation; thus, no new or altered facilities would be needed, which could result in associated adverse environmental impacts. No impacts regarding these respective issues would occur.

Water and Wastewater

Project development would not require construction or expansion of public water treatment and/or service systems or additional entitlements or resources response, which could cause significant environmental effects. The Project would have limited water needs during construction (i.e., for dust suppression and other construction needs) and operation (for maintenance needs). While water would be utilized during Project construction activities, the construction of new or expansion of existing, public water facilities would not be required. Restroom facilities during Project construction would be provided by portable units to be serviced by licensed providers. The Project would not exceed wastewater treatment requirements during construction because the Project would not be connected to a public sewer system. In addition, the Project would not exceed wastewater treatment requirements of the applicable RWQCB.

Solid Waste

Restroom facilities during Project construction would be provided by portable units to be serviced by licensed providers. Solid waste would include recyclable materials such as metals and plastics, as well as various construction materials and worker-generated waste that would include a combination of recyclable and non-recyclable materials. To the extent practicable, waste generated during construction and operation would be recycled. The non-recyclable, non-hazardous solid waste materials would be land filled in accordance with State and local regulations.

The Blythe landfill, which is closest to the Project area, has sufficient capacity to continue to provide solid waste disposal through 2047. Therefore, sufficient capacity is anticipated to be available for waste disposal. The Project would comply with applicable federal, State, and local regulations related to solid waste. No impact would occur and no mitigation is recommended.

Drainage Facilities

Project facilities would be sited to provide adequate setbacks between solar facility components (solar panels, gen-tie lines, substations, access roads, and O&M buildings) and natural washes (BMP-11). These setbacks would preserve and maintain the natural washes' hydrological functions. Construction of the Project would require ground-disturbing activities, including solar array installation, substation and O&M building construction, and construction of access roads. Grading could potentially alter naturally occurring drainage patterns and result in soil erosion, sedimentation, long-term siltation, and increased stormwater runoff, which increases the potential for flooding off-site or downstream of the construction areas. However, the Project area is relatively flat and would not require mass grading for construction purposes. The majority of the original grades and natural drainage features at the Project area would be maintained and, therefore, no added storm drainage control would be required. Blading and other methods of vegetation removal for clearance of roads and construction areas decrease the ability of the soil to absorb water, which also increases stormwater runoff from such disturbed areas. As part of the Project, BMP-1 (Drainage, Erosion, and Sedimentation Control Plan) and BMP-2 (Stormwater Pollution Prevention Plan) would be implemented to ensure minimization of impacts from storm water runoff and existing drainage patterns. In addition, the minimization of ground and surface disturbance (BMP-13), limitation of vehicle travel and traffic (BMP-14), and construction of new access roads and parking lots (BMP-15) would minimize impacts to the existing drainage patterns. Therefore, the Project would not require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

USS-2) Would the Project impact the following facilities requiring or resulting in the construction of new facilities or the expansion of existing facilities, the construction of which could cause significant environmental effects?

a) Electricity
b) Natural gas
c) Communications systems
d) Storm water drainage
e) Street lighting
f) Maintenance of public facilities, including roads
g) Other government services

Project construction, operation and maintenance, and decommissioning activities would not require construction of new utility facilities or the expansion of existing facilities. Please refer to the previous discussions above under PS-1, USS-1, and Section 4.2.9 with regards to electricity, natural gas, and storm water drainage. As previously explained, electricity within the vicinity of the Project area is provided by SCE. The power produced by the Project would be conveyed to the local power grid via interconnection to the SCE Colorado River Substation, an approved new

substation south of I-10 and west of the Project area. The Project has secured a CAISO interconnection queue position sufficient for the size of the Project. The Project would produce enough energy to power approximately 180,000 households and progress the goals of the California RPS and other similar renewable programs in the state, which are designed to serve existing and already-projected population growth. Implementation of the proposed Project would support the goals of the RPS and other renewable energy programs and would not conflict with any adopted energy conservation plans.

With regards to the maintenance of public facilities, including public roads, portions of Seeley Avenue and Riverside Drive would be improved to ensure safe emergency access to the site and surrounding residential areas. However, Project development would not require or result in the construction of new street lighting or additional maintenance to public facilities or roads, as construction traffic would occur during daytime hours and only last short-term. The minimal amount of permanent employee vehicle trips on local roadways during Project operations would not necessitate the expansions or construction of street lighting or cause additional burdens on local roadways resulting in increased maintenance.

USS-3) Would the Project conflict with any adopted energy conservation plans?

As discussed in USS-2, the power produced by the Project would produce renewable energy and support the goals of the RPS and would not conflict with adopted energy conservation plans. No impact.

Alternative 2: No Project

Under Alternative 2, the solar facility and gen-tie line would not be constructed and the site would retain its current land uses. Therefore, no direct or indirect impacts would occur to population, housing, public services, utilities, and socioeconomics, nor would the Project result in direct or indirect effects to minority or low-income populations related to construction, operation, or decommissioning activities.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Therefore, Alternative 3 would result in the same socioeconomic impacts, and it would not result in direct or indirect effects to minority or low-income populations related to construction, operation and maintenance, and decommissioning activities, similar to Alternative 1.

Application of CEQA Significance Thresholds

SOC-1) Would Alternative 3 induce substantial population growth in an area, either directly or indirectly?

Alternative 3 would temporarily increase the local population; however, it would not induce substantial permanent population growth in the area, either directly or indirectly. Less than significant impacts would occur.

SOC-2) Would Alternative 3 displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

Alternative 3 would not displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere. Less than significant impacts would occur.

SOC-3) Would Alternative 3 displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

Alternative 3 would not displace substantial numbers of people, necessitating the construction of replacement housing elsewhere. No impacts would occur.

SOC-4) Would Alternative 3 create a demand for additional housing, particularly housing affordable to households earning 80% or less of the County's median income?

As described in SOC-1, Alternative 3 would temporarily increase the local population; however, it would not contain a residential component that would result in a permanent increase in the population. Due to the temporary nature of Alternative 3 construction activities, it is unlikely that construction workers would permanently relocate closer to the Alternative 3 site with their families. Operation of Alternative 3 would require a nominal workforce and is not anticipated to increase the local population. Therefore, Alternative 3 would not create a demand for additional housing. Less than significant impact would occur and no mitigation is recommended.

SOC-5) Would Alternative 3 affect a County Redevelopment Project Area?

The Alternative 3 site and immediate vicinity would not be within a former County Redevelopment Project Area. No impact would occur and no mitigation is recommended.

SOC-6) Would Alternative 3 cumulatively exceed official regional or local population projections?

See SOC-4 above. Alternative 3 would temporarily increase the local population during construction; however, it would not include housing and would require a nominal operational workforce. Alternative 3 would not permanently increase the local population, nor would it cumulatively exceed regional or local population projections. Less than significant impact would occur.

PS-1) Would Alternative 3 result in substantial adverse physical impacts associated with the provision of public services?

Please refer to the discussion under Alternative 1, PS-1. Alternative 3's construction workforce would increase the local population temporarily, but would not result in significant demands on public services, such as education, law enforcement, fire protection, parks and recreation, and hospital facilities and emergency response. Alternative 3 would result in less than significant impacts to public services.

USS-1) Would Alternative 3 result in substantial adverse environmental impacts associated with the provision of utility services?

Please refer to the discussion under Alternative 1, USS-1. Alternative 3 would not result in substantial adverse environmental impacts associated with the provision of utility services. Impacts to utility services would be less than significant.

USS-2) Would Alternative 3 impact the following facilities requiring or resulting in the construction of new facilities or the expansion of existing facilities, the construction of which could cause significant environmental effects?

a) Electricity
b) Natural gas
c) Communications systems
d) Storm water drainage
e) Street lighting
f) Maintenance of public facilities, including roads
g) Other government services

Please refer to the discussion under Alternative 1, USS-2. Alternative 3 construction, operation and maintenance, and decommissioning activities would not require construction of new utility facilities or require the expansion of existing facilities. However, portions of Seeley Avenue and Riverside Drive would be improved to ensure safe emergency access to the site and surrounding residential areas.

Electricity within the vicinity of the Alternative 3 site is provided by SCE. The power produced by Alternative 3 would be conveyed to the local power grid via interconnection to the SCE Colorado River Substation, an approved new substation south of I-10 and approximately four miles west of the Alternative 3 site. Alternative 3 has secured a CAISO interconnection queue position sufficient for the size of Alternative 3. Alternative 3 would produce enough energy to power approximately 180,000 households and progress the goals of the RPS and other similar renewable programs in the state, which are designed to serve existing and already-projected population growth. Implementation of Alternative 3 would support the goals of the RPS and other renewable energy programs and would not conflict with any adopted energy conservation plans. No impact.

USS-3) Would Alternative 3 conflict with any adopted energy conservation plans?

As discussed in USS-2 above, Alternative 3 would not conflict with any adopted energy conservation plan. No impact and no mitigation recommended.

Alternative 4: Northern Alternative 230 kV Gen-tie Line Location

Alternative 4 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Therefore, Alternative 4 would result in the same impacts to population, housing, public services, utilities, and socioeconomics; it would not result in direct or indirect effects to minority or low-income populations related to construction, operation and maintenance, or decommissioning activities.

Application of CEQA Significance Thresholds

SOC-1) Would Alternative 4 induce substantial population growth in an area, either directly or indirectly?

Alternative 4 would not induce substantial population growth in the area, either directly or indirectly. No impacts would occur.

SOC-2) Would Alternative 4 displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

Alternative 4 would not displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere. Less than significant impacts would occur.

SOC-3) Would Alternative 4 displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

Alternative 4 would not displace substantial numbers of people, necessitating the construction of replacement housing elsewhere. No impacts would occur.

SOC-4) Would Alternative 4 create a demand for additional housing, particularly housing affordable to households earning 80% or less of the County's median income?

Alternative 4 would not contain a residential component that would result in an increase in the population. Due to the temporary nature of Project construction activities, it is unlikely that construction workers would permanently relocate closer to Alternative 4 site with their families. Operation of Alternative 4 would require a nominal workforce and is not anticipated to increase the local population. Therefore, Alternative 4 would not create a demand for additional housing. No impact would occur and no mitigation is recommended.

SOC-5) Would Alternative 4 affect a County Redevelopment Project Area?

The Alternative 4 site and immediate vicinity would not be within a former County Redevelopment Project Area. No impact would occur and no mitigation is recommended.

SOC-6) Would Alternative 4 cumulatively exceed official regional or local population projections?

See SOC-4 above. Alternative 4 would not include housing and would require a nominal operational workforce. Alternative 4 would not increase the local population, nor would it cumulatively exceed regional or local population projections.

PS-1) Would Alternative 4 result in substantial adverse physical impacts associated with the provision of public services?

Please refer to the discussion under Alternative 1, PS-1. Alternative 4's construction workforce would increase the local population temporarily, but would not result in significant demands on public services, such as education, law enforcement, fire protection, parks and recreation, and hospital facilities and emergency response. Alternative 4 would result in less than significant impacts to public services.

USS-1) Would Alternative 4 result in substantial adverse environmental impacts associated with the provision of utility services?

Please refer to the discussion under Alternative 1, USS-1. Alternative 4 would not result in substantial adverse environmental impacts associated with the provision of utility services. Impacts to utility services would be less than significant.

USS-2) Would Alternative 4 impact the following facilities requiring or resulting in the construction of new facilities or the expansion of existing facilities, the construction of which could cause significant environmental effects?

a) Electricity
b) Natural gas
c) Communications systems
d) Storm water drainage
e) Street lighting
f) Maintenance of public facilities, including roads
g) Other government services

Please refer to the discussion under Alternative 1, USS-2. Alternative 4 construction, operation and maintenance, and decommissioning activities would not require construction of new utility facilities or require the expansion of existing facilities. However, portions of Seeley Avenue and Riverside Drive would be improved to ensure safe emergency access to the site and surrounding residential areas.

Electricity within the vicinity of the Alternative 4 site is provided by SCE. The power produced by Alternative 4 would be conveyed to the local power grid via interconnection to the SCE Colorado River Substation, an approved new substation south of I-10 and approximately four miles west of the Alternative 4 site. Alternative 4 has secured a CAISO interconnection queue position sufficient for the size of Alternative 4. Alternative 4 would produce enough energy to power approximately 180,000 households and progress the goals of the RPS and other similar renewable programs in the state, which are designed to serve existing and already-projected population growth. Implementation of Alternative 4 would support the goals of the RPS and other renewable energy programs and would not conflict with any adopted energy conservation plans.

USS-3) Would Alternative 4 conflict with any adopted energy conservation plans?

See USS-2 above.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between

Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Alternative 5 would have one on-site substation and one O&M building and would have one access point (planned on Seeley Avenue). The Reduced Acreage Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility. Approximately 400 daily workers (compared to 500 under the proposed Project) would be present on-site during peak construction. The O&M building would serve the Project's approximately seven permanent full-time employees.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but not within the City limits of Blythe in comparison to the proposed Project. Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The construction, operation, maintenance, and decommissioning of Alternative 5 would not exceed those population, housing, public services, utilities, and socioeconomic impacts identified under the Alternative 1 analysis. Therefore, the Alternative 1 analysis would be applicable to Alternative 5, outside of those differences identified in the discussion below.

Alternative 5 would have a reduced workforce in comparison to Alternative 1. However, this reduction is not substantial relative to population, housing, public services, utilities, and socioeconomics. Therefore, impacts from Alternative 5 are anticipated to be similar to that of Alternative 1 for population, housing, public services, utilities, and socioeconomics; it would not result in direct or indirect effects to minority or low-income populations related to construction, operation and maintenance, or decommissioning activities.

Application of CEQA Significance Thresholds

SOC-1) Would Alternative 5 induce substantial population growth in an area, either directly or indirectly?

Similar to Alternative 1, Alternative 5 construction would temporarily increase population growth in the area; however, it would not be substantial. The SOC-1 Alternative1 analysis would apply to Alternative 5. No significant construction- or operation-related impacts are expected for the regional and local study area housing supply, availability, or demand. Alternative 5 would not displace populations or existing housing, and it would not necessitate construction of replacement housing elsewhere.

SOC-2) Would Alternative 5 displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

While Alternative 5 would displace three existing residences within the Alternative 5 development area south of I-10, there is available housing within the Alternative 5 area to relocate the residents of these residential units elsewhere. Similar to Alternative 1, implementation of Alternative 5 would not require the construction of replacement housing elsewhere. Impacts to existing housing as a result of Alternative 5 implementation would not be significant and no mitigation is recommended.

SOC-3) Would Alternative 5 displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

Similar to Alternative 1, Alternative 5 would not displace substantial numbers of people, necessitating the construction of replacement housing elsewhere. No impacts would occur.

SOC-4) Would Alternative 5 create a demand for additional housing, particularly housing affordable to households earning 80% or less of the County's median income?

The SOC-4 analysis for Alternative 1 would apply to Alternative 5.

SOC-5) Would Alternative 5 affect a County Redevelopment Project Area?

The SOC-5 analysis for Alternative 1 would apply to Alternative 5.

SOC-6) Would Alternative 5 cumulatively exceed official regional or local population projections?

Alternative 5 would not include housing and would require a nominal operational workforce. Alternative 5 would not increase the local population, nor would it cumulatively exceed regional or local population projections.

PS-1) Would Alternative 5 result in substantial adverse physical impacts associated with the provision of public services?

The PS-1 analysis under Alternative 1 would apply to Alternative 5, as Alternative 5 development construction workforce would increase the local population temporarily, but would not result in significant demands on public services, such as education, law enforcement, fire protection, parks and recreation, and hospital facilities and emergency response. A reduced footprint would result in impacts no greater than those described under the Alternative 1 analysis. Alternative 5 would not result in substantial adverse physical impacts associated with the provision of public services. The temporary addition of construction workers to the area's population is not anticipated to increase school enrollment that could result in adverse physical impacts associated with the provision of school facilities. No impact would occur and no mitigation recommended. Because Alternative 5 construction is not anticipated to increase the local population, no new or expanded law enforcement facilities or increased staff levels within the Alternative 5 regional or local study area would be required, nor would Alternative 5 development result in substantial adverse physical impacts on law enforcement facilities. Adverse physical impacts to fire protection services during construction and operation are considered to be less than significant and no mitigation is recommended. No physical adverse impacts would result to parks and recreational facilities. Alternative 5 construction would not result in adverse physical impacts to hospital facilities within the Alternative 5 regional or local study area.

Similar to Alternative 1, due to the temporary nature of Alternative 5 construction activities, it is unlikely that construction workers would permanently relocate closer to the solar facility with their families. Additionally, operation of Alternative 5 would require a nominal workforce and is not anticipated to increase the local population. Therefore, Alternative 5 would not make significant physical demands on education, law enforcement, fire protection, parks and recreation, and hospital facilities. Alternative 5 would not eliminate any lands designated for recreational use. No physical impacts associated with the provision of parks and recreational facilities would occur and no mitigation is recommended. Operation of Alternative 5 would not result in physical adverse impacts on medical facilities in the area because minor injuries could be treated at Palo Verde Hospital in Blythe, California or La Paz Medical Services in Quartzsite, Arizona. Injuries resulting in significant trauma would be treated at the Desert Regional Medical Center in Palm Springs, California, which is approximately one hour and twenty minutes by Medevac (Cox 2011). No significant impact would occur and no mitigation is recommended.

USS-1) Would Alternative 5 result in substantial adverse environmental impacts associated with the provision of utility services?

Similar to Alternative 1, the Reduced Acreage Alternative would not result in substantial adverse environmental impacts associated with the provision of utility services. The USS-1 analysis for Alternative 1 would apply to Alternative 5.

Electricity and Natural Gas

As the Reduced Acreage Alternative would involve a reduced amount of development in comparison to what was considered under Alternative 1, Alternative 5 would not induce substantial growth to the regional population levels. Therefore, demands on the electrical and

natural gas systems would be nominal and there would be no need to alter these existing facilities in response, which could result in associated adverse environmental impacts.

Water and Wastewater

Similar to Alternative 1, Alternative 5 would not induce substantial growth to the regional population levels; as such, demands on water and wastewater systems would be nominal and there would be no need to alter these existing facilities in response, which could cause significant environmental effects.

Solid Waste

Similar to Alternative 1, Alternative 5 would not induce substantial growth to the regional population levels; as such, the associated generation of solid waste would be nominal and there would be no need to alter these existing solid waste facilities in response, which could result in associated adverse environmental impacts.

Drainage Facilities

The development of Alternative 5 would be identical to Alternative 1 south of I-10. As such, Project facilities would be sited to provide adequate setbacks between solar facility components (solar panels, gen-tie lines, substation, access roads, and O&M building) and natural washes. The Alternative 1 analysis would apply. As no development would occur north of the freeway, these lands would exist in their current state.

USS-2) Would Alternative 5 impact the following facilities requiring or resulting in the construction of new facilities or the expansion of existing facilities, the construction of which could cause significant environmental effects?

a) Electricity
b) Natural gas
c) Communications systems
d) Storm water drainage
e) Street lighting
f) Maintenance of public facilities, including roads
g) Other government services

The USS-2 analysis for Alternative 1 would apply to Alternative 5. Alternative 5 construction, operation and maintenance, and decommissioning activities would not require construction of new utility facilities or the expansion of existing facilities.

USS-3) Would Alternative 5 conflict with any adopted energy conservation plans?

See USS-2.

Cumulative Impacts

Geographic Scope

Temporary cumulative population and housing impacts could occur when overlapping construction schedules of multiple projects create a demand for workers that cannot be met by the local labor force, thereby inducing in-migration of non-local labor and their households. Operational cumulative population and housing impacts could occur when multiple projects cause a substantial increase in population in an area that leads to demand for housing that exceeds available capacity.

The BMSP would have substantial beneficial socioeconomic impacts during construction and operations in terms of job creation, expenditures, and tax revenues. In fact, the positive incremental impacts of the

Project, including job creation, expenditures, and tax revenues, would combine with the similar positive socioeconomic impacts from other present and reasonably foreseeable future projects in the Project vicinity (Table 4.1-1) to create even greater positive cumulative impacts to the local economy.

Temporal Scope

The timeframe refers to the duration over which an impact would occur: short-term or long-term. Short-term impacts to population and housing would occur during the construction and decommissioning periods when overlapping construction schedules of multiple projects create a demand for workers that cannot be met by the local labor force.

Analysis of Direct and Indirect Impacts

Alternative 1: Proposed Project

Construction, Operation, Maintenance, and Decommissioning

Temporary cumulative population and housing impacts could occur when overlapping construction schedules of multiple projects create a demand for workers that cannot be met by the local labor force, thereby inducing in-migration of non-local labor and their households. Operational cumulative population and housing impacts could occur when multiple projects cause a substantial increase in population in an area that leads to demand for housing that exceeds available capacity (Impact SOC-1).

The proposed Project would have substantial beneficial socioeconomic impacts during construction and operation in terms of job creation, expenditures, and tax revenues. In fact, the positive incremental impacts of the Project, including job creation, expenditures, and tax revenues, would combine with the similar positive socioeconomic impacts from other present and reasonably foreseeable future projects in the Project vicinity (Table 4.1-1) to create even greater positive cumulative impacts to the local economy.

Construction of the present and reasonably foreseeable future projects may overlap with construction of the proposed Project. Construction of the Devers-Palo Verde No. 2 transmission line, including the new SCE Colorado River Substation, is expected to be complete and in service by the third quarter of 2013, prior to anticipated commencement of Project construction in the fourth quarter of 2013. The CEC Decision for BSPP analyzed average and peak construction labor needs by construction craft for the BSPP, Palen Solar Power Project, Genesis Solar Energy Project, and Desert Sunlight Solar Farm and compared them to the available labor force for these projects. This analysis determined that these projects would have total peak monthly labor needs of 4,189 workers and total peak monthly local housing needs of 562 housing units. The proposed Project would have peak monthly labor needs of 500 workers.

Under the conservative assumption that peak construction periods overlap for all reasonably foreseeable projects, there would be an increased demand for temporary housing units in the cumulative area. As discussed in Section 4.2.13, *Population, Housing, Public Services, Utilities, and Socioeconomics*, the vacancy rates for housing units are high and there are number of temporary housing options available as well. Available housing supply in the study area far exceeds conservative estimates of cumulative demand. There is an ample supply of housing units to accommodate workers drawn from the study area. Therefore, the incremental effects of the Project, when considered together with other past, present, and reasonably foreseeable future projects, would not result in cumulatively significant, adverse impacts to housing supply during construction.

Operational labor needs of the reasonably foreseeable future projects and the Project are substantially smaller than construction labor needs and would not contribute to a cumulatively significant increase in demand for housing that exceeds available supply (impacts SOC-1 through SOC-4).

The proposed Project would not result in significant adverse environmental or public health impacts that could impact any human populations. Due to their nature as solar energy projects and their location in

relation to the proposed Project, reasonably foreseeable future projects would not compound or increase proposed Project effects in a manner that would result in significant adverse environmental or public health impacts (impact USS-1).

Environmental Justice

The Project would have no impacts related to environmental justice; therefore, it would not cause or contribute to any cumulative impacts in this regard.

Public Services and Utilities

Operational cumulative impacts to public service and utility providers could occur when multiple projects cause a substantial increase in population in an area that leads to demand for schools, public services, or utilities that exceeds available capacity (impacts PS-1 USS-1 and USS-2).

Construction of the present and reasonably foreseeable future projects (Table 4.1-1) may overlap with construction of the Project. The temporary placement of construction workers within existing housing units, motel and hotel rooms, RV parks, and campsites would not result in adverse impacts to schools, public services, or utilities, since these facilities have already been accounted for in existing plans for public services and utilities.

It is anticipated that the construction workforce for the proposed Project, in conjunction with those under the cumulative scenario, would be drawn from Riverside County, with a smaller portion drawn from the Imperial County and La Paz County. It would be unlikely that construction workers would relocate close to the various Project areas with their families due to the temporary nature of the construction periods associated with these projects. Therefore, the temporary addition of construction workers to the proposed Project area's population, along with those noted in Table 4.1-1, is not anticipated to increase school enrollment. In addition, the Palo Verde Unified School District is currently below enrollment capacity; enrollment capacity has been declining, and this trend is expected to continue. Therefore, any increased temporary demand within this district would potentially have beneficial effects.

Cumulative operational impacts to public services including police, fire, hazardous materials handling, and medical resources and facilities would not be cumulatively considerable due to compliance with existing agency regulations, including preparation of worker safety and fire prevention programs. Reasonably foreseeable future projects and the proposed Project would comply with agency regulations addressing operational impacts to public services. Construction of the proposed Project in conjunction with those under the cumulative scenario could increase demands on police services. However, during construction, on-site security would include trained, uniformed, and unarmed personnel whose primary responsibility would be to control ingress and egress of personnel and vehicles, perform fire and security watch during off hours, and perform security badge administration, all of which would minimize the potential need for the City of Blythe Police Department's and the Riverside County Sheriff's Department's assistance. As discussed above, the construction workforce for the Project would be hired generally from within the available regional workforce. Because proposed Project construction is not anticipated to increase the local population, no new or expanded law enforcement facilities or increased staff levels within the proposed Project regional or local study area would be required. Construction of the proposed Project would generate truck and employee traffic along haul routes and at the Project area, which could temporarily increase the accident potential in these areas over the short-term construction period. However, the additional volume of traffic associated with workers commuting to the sites during construction would be temporary and it is anticipated that personnel and equipment from the City and the CHP would be sufficient to respond to incidents in the Project area. Therefore, the proposed Project's direct and indirect contribution towards cumulative effects to law enforcement facilities or increased staff levels, including short-term effects during construction and long-term operation, would not be considerable (impact PS-1).

There are three existing residences within the Project area (see Figure 3.2.1-1, *Residences within One Mile of the Proposed Project*) that are associated with the existing agricultural operations. The proposed Project would displace those three residences; however, there is available housing within the vicinity of

the Project area to relocate these residents. Implementation of the proposed Project would not require the construction of replacement housing elsewhere. After the construction phase, the O&M buildings would serve as the proposed Project's facilities for a limited number of permanent full-time employees. The proposed Project would include emergency access and other safety features and plans for fire protection. Portions of Seeley Avenue and Riverside Drive would be improved to ensure safe emergency access to the site and surrounding residential areas.

The Project area is not within an area of very high or high fire hazard, as determined by CAL FIRE. During construction, there is the potential for both small fires and major structural fires. Electrical sparks, combustion of fuel oil, hydraulic fluid, mineral oil, or insulating fluid at substations, or flammable liquids, explosions, and over-heated equipment may cause small fires. The Project and cumulative projects listed on Table 4.1-1 would result in an increase in demand for fire protection services over existing levels during construction. However, it is anticipated that personnel and equipment from the City of Blythe Volunteer Fire Department, the RCFD, and CAL FIRE would be sufficient to respond to a fire at the Project area because the O&M buildings would include their own emergency power, fire suppression, and potable water systems. Implementation of BMP-4, Fire Management and Protection Plan, would ensure that emergency fire precautions are employed during Project construction. The construction of cumulative projects listed in Table 4.1-1 may result in cumulative impacts to fire protection services and may require upgrades to existing facilities and equipment. Similar to Alternative 1, all of the related projects in Riverside County listed in Table 4.1-1 would be required to pay development impact fees and property taxes that would assist the County of Riverside and City of Blythe with any potential facility upgrades for fire protection services (Impacts PS-1 and USS-1). Therefore, the proposed Project's direct and indirect contribution towards cumulative effects on fire protection, including short-term effects during construction and long-term effects during operation, would not be considerable regarding fire protection services.

The Project would produce enough energy to power approximately 180,000 households and progress the goals of the California RPS and other similar renewable programs in the state, which are designed to serve existing and already-projected population growth. Implementation of the proposed Project would support the goals of the RPS and other renewable energy programs and would not conflict with any adopted energy conservation plans. Therefore, the proposed Project's direct and indirect contribution towards cumulative effects on electricity would not be considerable.

In addition, cumulative operational impacts to utilities would not be cumulatively considerable (impacts USS-1 and USS-2). The Project would utilize on-site groundwater and treat wastewater on-site. There is no potential for the Project to contribute to cumulative impacts to water or wastewater systems. Cumulative impacts to groundwater are discussed in Section 4.2.9. The Project would not utilize natural gas, and the Project would not exceed existing capacity and require the construction of new facilities or infrastructure to meet demand. Cumulative impacts to electrical infrastructure would not occur.

Alternative 2: No Project Alternative

Under the No Project Alternative, gen-tie facilities would not be constructed on BLM-managed lands and solar facilities would not be constructed on private lands. The public lands in the Project area would continue to be managed by BLM in accordance with existing land use designations in the CDCA Plan, whereas the private lands would continue to be managed for agricultural production. Alternative 2 would not contribute to cumulative impacts on population, housing, public services, and utilities. This Alternative would also not contribute cumulatively towards growth-inducing and socioeconomics impacts.

Alternative 3: Northern 230 kV Gen-tie Line Location

Alternative 3 is similar to Alternative 1 (proposed Project), with the exception of the location of the Northern 230 kV gen-tie line, which would be approximately 700 feet north of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1. Therefore, the impacts associated with Alternative 3 would the same as those from Alternative 1.

Development of Alternative 3 would also result in substantial beneficial socioeconomic impacts during construction and operations in terms of job creation, expenditures, and tax revenues. There is an ample supply of housing units to accommodate workers within the Study area. Therefore, the incremental effects of Alternative 3, when considered together with other past, present, and reasonably foreseeable future projects, would not result in cumulatively significant, adverse impacts to housing supply during construction, operation, maintenance, and decommissioning (impacts SOC-1 through SOC-4).

Alternative 3 would also not result in significant adverse environmental or public health impacts that could impact any human populations. Due to their nature as solar energy projects and their location in relation to Alternative 3, reasonably foreseeable future projects would not compound or increase Alternative 3 effects in a manner that would result in significant adverse environmental or public health impacts (impact USS-1).

It would be unlikely that construction workers would relocate close to the various Project areas with their families due to the temporary nature of the construction periods associated with these projects. Therefore, the temporary addition of construction workers for the cumulative projects and Alternative 3 are not anticipated to increase school enrollment. In addition, the Palo Verde Unified School District is currently below enrollment capacity; enrollment capacity has been declining, and this trend is expected to continue. Therefore, any increased temporary demand within this district would potentially have beneficial effects.

The workforce required for operation would be similar or less than that of current agricultural operations; therefore, the Alternative 5 is not a cumulatively considerable contributor to cumulative impacts to public services including police, hazardous materials handling, and medical resources and facilities. Additionally, all cumulative projects, including Alternative 5, would be required to comply with existing agency regulations, including preparation of worker safety and fire prevention programs. Because Alternative 3 construction is not anticipated to permanently increase the local population, no new or expanded law enforcement facilities or increased staff levels within the proposed Project regional or local study area would be required. The additional truck and employee traffic along haul routes form construction of Alternative could temporarily increase the accident potential in these areas over the short-term construction period. However, the additional volume of traffic associated with workers commuting to the sites during construction would be temporary and it is anticipated that personnel and equipment from the City and the CHP would be sufficient to respond to incidents in the Alternative 3 area. Therefore, this alternatives direct and indirect contribution towards cumulative effects to law enforcement facilities or increased staff levels, including short-term effects during construction and long-term operation, would not be considerable (impact PS-1).

Alternative 3 would include emergency access and other safety features and plans for fire protection. Portions of Seeley Avenue and Riverside Drive would be improved to ensure safe emergency access to the site and surrounding residential areas.

It is anticipated that personnel and equipment from the RCFD and CAL FIRE would be sufficient to respond to a fire at the Alternative 3 site because the O&M buildings would include their own emergency power, fire suppression, and potable water systems. Implementation of BMP-4, Fire Management and Protection Plan, would ensure that emergency fire precautions are employed during Alternative 3 construction. The construction of cumulative projects listed in Table 4.1-1 may result in cumulative impacts to fire protection services and may required upgrades to existing facilities and equipment. Similar to Alternative 1, all of the related projects in Riverside County listed in Table 4.1-1 would be required to pay development impact fees and property taxes that would assist the County of Riverside and City of Blythe with any potential facility upgrades for fire protection services and equipment (Impacts PS-1 and USS-1). Therefore, this alternative's direct and indirect contribution towards cumulative effects on fire protection, including short-term effects during construction and long-term effects during operation, would not be considerable regarding fire protection services.

Cumulative operational impacts to utilities would not be cumulatively considerable (impacts USS-1 and USS-2). Alternative 3 would also utilize on-site groundwater and treat wastewater on-site. As with Alternative 1, there is no potential for Alternative 3 to contribute to cumulative impacts to water or

wastewater systems. Cumulative impacts to groundwater are discussed in Section 4.2.9. Alternative 3 would not utilize natural gas, and Alternative 3 would not exceed existing capacity and require the construction of new facilities or infrastructure to meet demand. Cumulative impacts to electrical infrastructure would not occur.

Alternative 4: Southern 230 kV Gen-tie Line Location

Alternative 4 is similar to Alternative 1 (proposed Project), with the exception of the location of the Southern 230 kV gen-tie line, which would be approximately 0.8 mile south of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1.

Development of Alternative 4 would also result in substantial beneficial socioeconomic impacts during construction and operations in terms of job creation, expenditures, and tax revenues. This could combine with the similar positive socioeconomic impacts from other present and reasonably foreseeable future cumulative projects in the Alternative 4 vicinity to create even greater positive cumulative impacts to the local economy.

Construction of the present and reasonably foreseeable future projects may overlap with construction of this Alternative as well, comparative to Alternative 1. There is an ample supply of housing units to accommodate workers drawn from outside the one-hour commute area. Therefore, the incremental effects of Alternative 4, when considered together with other past, present, and reasonably foreseeable future projects, would not result in cumulatively significant, adverse impacts to housing supply during construction (impacts SOC-1 through SOC-4).

Operational labor needs of the reasonably foreseeable future projects and Alternative 4 are substantially smaller than construction labor needs and would not contribute to a cumulatively significant increase in demand for housing that exceeds available supply (impacts SOC-1 through SOC-4).

Alternative 4 would also not result in significant adverse environmental or public health impacts that could impact any human populations. Due to their nature as solar energy projects and their location in relation to Alternative 4, reasonably foreseeable future projects would not compound or increase Alternative 4 effects in a manner that would result in significant adverse environmental or public health impacts (impact USS-1).

It would be unlikely that construction workers would relocate close to the various Project areas with their families due to the temporary nature of the construction periods associated with these projects. Therefore, the temporary addition of construction workers to the Alternative 4 area's population, along with those noted in Table 4.1-1, are not anticipated to increase school enrollment.

Cumulative operational impacts to public services including police, fire, hazardous materials handling, and medical resources and facilities would not be cumulatively considerable due to compliance with existing agency regulations, including preparation of worker safety and fire prevention programs. Construction of Alternative 4 in conjunction with those under the cumulative scenario could increase demands on police services. However, during construction, on-site security would remain on-site to minimize demands potential need for the City of Blythe Police Department's and the Riverside County Sheriff's Department's assistance. Because Alternative 4 construction is not anticipated to increase the local population, no new or expanded law enforcement facilities or increased staff levels within the proposed Project regional or local study area would be required. The additional volume of traffic associated with workers commuting to the sites during construction would be temporary and it is anticipated that personnel and equipment from the City and the CHP would be sufficient to respond to incidents in the Alternative 4 area. Therefore, this Alternative's direct and indirect contribution towards cumulative effects to law enforcement facilities or increased staff levels, including short-term effects during construction and long-term operation, would not be considerable (Impact PS-1).

Alternative 4 would include emergency access and other safety features and plans for fire protection. Portions of Seeley Avenue and Riverside Drive would be improved to ensure safe emergency access to the site and surrounding residential areas.

Alternative 4 would result in an increase in demand for fire protection services over existing levels during construction. To reduce the Project impacts to fire protection services, the O&M buildings would include their own emergency power, fire suppression, and potable water systems. Implementation of BMP-4, Fire Management and Protection Plan, would ensure that emergency fire precautions are employed during Alternative 4 construction. The construction of cumulative projects listed in Table 4.1-1 may result in cumulative impacts to fire protection services and may required upgrades to existing facilities and equipment. Alternative 4 and all of the related projects in Riverside County listed in Table 4.1-1 would be required to pay development impact fees and property taxes that would assist the County of Riverside and City of Blythe with any potential facility upgrades for fire protection services and equipment (Impacts PS-1 and USS-1).

Similar to Alternative 1, Alternative 4's cumulative operational impacts to utilities would not be cumulatively considerable (impacts USS-1 and USS-2). Alternative 4 would also utilize on-site groundwater and treat wastewater on-site. As with Alternative 1, there is no potential for Alternative 4 to contribute to cumulative impacts to water or wastewater systems. Cumulative impacts to groundwater are discussed in Section 4.2.9. Alternative 4 would not utilize natural gas, and Alternative 4 would not exceed existing capacity and require the construction of new facilities or infrastructure to meet demand. Cumulative impacts to electrical infrastructure would not occur.

Alternative 5: Reduced Acreage Alternative

The Reduced Acreage Alternative would also create beneficial socioeconomic impacts during construction and operation in terms of job creation, expenditures, and tax revenues. As development under this Alternative would be reduced relative to the footprint associated with Alternative 1, there would be a reduced slightly reduced workforce during construction and operations. However, the positive incremental impacts of Alternative 5, including job creation, expenditures, and tax revenues, would combine with the similar positive socioeconomic impacts from other present and reasonably foreseeable future projects in the Project vicinity to create even greater positive cumulative impacts to the local economy.

As determined in the cumulative analysis for Alternative 1, the available housing supply in the study area far exceeds conservative estimates of cumulative demand. There is an ample supply of housing units to accommodate workers drawn from outside the study area. Therefore, the incremental effects of Alternative 5, when considered together with other past, present, and reasonably foreseeable future projects, would not result in cumulatively significant, adverse impacts to housing supply during construction (impacts SOC-1 through SOC-4).

Operational labor needs of the reasonably foreseeable future projects and Alternative 5 are substantially smaller than construction labor needs and would not contribute to a cumulatively significant increase in demand for housing that exceeds available supply.

Alternative 5 would not result in significant adverse environmental or public health impacts that could impact any human populations. Due to their nature as solar energy projects and their location in relation to Alternative 5, reasonably foreseeable future projects would not compound or increase Alternative 5 effects in a manner that would result in significant adverse environmental or public health impacts (impact USS-1).

Operational cumulative impacts to public service and utility providers could occur when multiple projects cause a substantial increase in population in an area that leads to demand for schools, public services, or utilities that exceeds available capacity (impacts PS-1 USS-1 and USS-2).

Construction of the present and reasonably foreseeable future projects (Table 4.1-1) may overlap with construction of Alternative 5. Similar to Alternative 1, Alternative 5's temporary placement of construction

workers within existing housing units, motel and hotel rooms, RV parks, and campsites would not result in adverse impacts to schools, public services, or utilities.

It would be unlikely that construction workers would relocate close to the various Project areas with their families due to the temporary nature of the construction periods associated with these projects. Therefore, not anticipated increase school enrollment would occur.

Cumulative operational impacts to public services including police, fire, hazardous materials handling, and medical resources and facilities would not be cumulatively considerable due to compliance with existing agency regulations, including preparation of worker safety and fire prevention programs. Reasonably foreseeable future projects and Alternative 5 would comply with agency regulations addressing operational impacts to public services. The discussion under Alternative 1 would apply as no additional impacts to public services would occur under Alternative 5.

Alternative 5 would include emergency access and other safety features and plans for fire protection. Portions of Seeley Avenue would be improved to ensure safe emergency access to the site and surrounding residential areas.

Alternative 5 would result in an increase in demand for fire protection services over existing levels during construction. To reduce the Project impacts to fire protection services, the O&M buildings would include their own emergency power, fire suppression, and potable water systems. Implementation of BMP-4, Fire Management and Protection Plan, would ensure that emergency fire precautions are employed during Alternative 5 construction. The construction of cumulative projects listed in Table 4.1-1 may result in cumulative impacts to fire protection services and may required upgrades to existing facilities and equipment. Alternative 5 and all of the related projects in Riverside County listed in Table 4.1-1 would be required to pay development impact fees and property taxes that would assist the County of Riverside and City of Blythe with any potential facility upgrades for fire protection services and equipment (Impacts PS-1 and USS-1).

Similar to Alternative 1, Alternative 5's cumulative operational impacts to utilities would not be cumulatively considerable (impacts USS-1 and USS-2). Alternative 4 would also utilize on-site groundwater and treat wastewater on-site. As with Alternative 1, there is no potential for Alternative 5 to contribute to cumulative impacts to water or wastewater systems. Cumulative impacts to groundwater are discussed in Section 4.2.9. Alternative 5 would not utilize natural gas, and Alternative 5 would not exceed existing capacity and require the construction of new facilities or infrastructure to meet demand. Cumulative impacts to electrical infrastructure would not occur.

Mitigation Measures

All impacts would be less than significant; no mitigation measures are recommended.

Residual Impacts

With implementation of the above-listed BMPs as part of the Project, the Project would result in less than significant impacts to Population, Housing, Public Services, Utilities, and Socioeconomics.

NEPA Conclusions

The Project and each of the action Alternatives would involve the direct and indirect impacts and contribution toward cumulative impacts that are described above. The Project and the action Alternatives would not have an adverse environmental justice impact, would not create a new demand for housing, and could be adequately served by existing utilities and services without the need for new or altered facilities. The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged.

4.2.14 Recreation

This section describes the impact analysis relating to recreation for the proposed Project and Alternatives.

Methodology for Analysis

This section analyzes potential effects of the proposed Project and Alternatives related to recreation and assesses the impacts to known recreational facilities and uses. The Riverside County Regional Park and Open-Space District also provides several recreational facilities in the Project vicinity. The City of Blythe has several parks that provide sporting opportunities in the area. The CDCA Plan recognizes that the California Desert is "a reservoir of open space and…a place for outdoor recreation" (BLM 1980, p. 69). The CDCA Plan notes that the diverse landscape of the California desert provides for a variety of physical settings. Further, the CDCA Plan identifies the wide variety of desert recreation uses, ranging from off-road vehicles to outdoor preservationists, and the increasing challenge to accommodate these varied and sometimes competing uses. The CDCA Plan and NECO Plan Amendment, which includes a detailed inventory and designation of open routes for motorized-vehicle use, were reviewed to determine impacts to open routes.

CEQA Significance Criteria

The criteria listed below were used to determine if the proposed Project would result in impacts to recreation. These criteria were obtained from the CEQA Environmental Checklist, Appendix G of the 2012 CEQA Guidelines. Under CEQA, the proposed Project and Alternatives would have a significant impact on recreation if they would:

REC-1) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

REC-2) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

The following additional significance criterion from the County of Riverside Environmental Assessment form is used in the analysis. A project could have potentially significant impacts if it would be:

REC-3) Located within a Community Service Area (CSA) or recreation and park district with a Community Parks and Recreation Plan (Quimby fees).

NEPA Requirements

Pursuant to NEPA, this analysis is intended to compare the Alternatives and identify any adverse effects to recreational resources that cannot be avoided. Adverse effects may be direct, indirect, or cumulative. Potential direct and indirect effects of the proposed Project and Alternatives are analyzed below and discussed as construction-related, operation- and maintenance-related, and decommissioning effects.

Applicable Best Management Practices

No BMPs are recommended for Recreation.

Alternative 1: Proposed Project

Analysis of Direct and Indirect Impacts

Construction and Decommissioning

According to the Recreation Element of the CDCA Plan, "lands managed by the BLM are especially significant to recreationists. Therefore, actions which restrict vehicular access may affect opportunities for recreation depending on the specific activity pursued and/or the specific location at which such restrictions are imposed." As an indirect effect of the Project, recreationists could compensate for the loss of Class M public lands by utilizing other desert lands in the vicinity of the Project for their recreational experiences and benefits. This could result in more concentrated use of those areas, leading to loss of some native vegetation, wildlife habitat fragmentation or loss, elevated soil loss, increases in noise, and possible temporary declines in air quality from more concentrated vehicle use in a smaller available area. However, this impact would be minimal because, as discussed above, the land is privately owned and not available to the public, and high recreational use has not been observed within the Project area. As illustrated in Chapter 3, Figure 3.2.14-2, *NECO Plan Route Designations,* the proposed Project's gen-tie line that would extend outside the solar facility site would traverse NECO Plan Designated Open Routes 0660703, 660863 and 660862. During construction, these routes would closed and re-routed around construction zones; however, the NECO Plan Designated Open Routes would be open for use after construction.

Regional BLM recreational facilities described in Section 3.2.12 include long-term camping facilities (LTVAs) and supporting recreational uses. The Midland and Mule Mountains LTVA can each accommodate several hundred units, and current use is much lower than capacity. Some construction workers could reside in RV campers at the LTVAs, or possibly camp on public lands in the vicinity of the Project area during the construction phase of the Project; The Midland and Mule Mountains LTVAs allow camping up to seven months (September 14 to April 16) with a special use permit. Outside of these dates, the camping is limited to 14 days. Depending on the number of workers using the LTVAs, use could affect the social setting or the physical infrastructure of the LTVAs. However, the LTVAs are designed with minimal facilities given that campers must use self-contained RVs and there are no assigned or designated sites. Except for the designated campsites at Wiley's Well and Coon Hollow, each LTVA can accommodate several hundred RV units with a minimum distance of 15 feet between units. However, there are limitations to the campsites, such as seasonal availability, length of stay, and types of on-site facilities available. In addition, as discussed in Section 4.2.13, *Population, Housing, Public Services, Utilities, and Socioeconomics*, there are other temporary, affordable housing alternatives, such as seasonal or vacation home rentals, that are available in the vicinity of the Project area that don't have as many limitations and offer more facilities. Therefore, although some construction workers might decide to reside in LTVAs, it is anticipated that most workers intending to camp will select long-term camping facilities nearby that are sufficient to support the proposed Project. It is anticipated that the authorized use of LTVAs by temporary construction workers would result in a minimal increase. Therefore, minimal impacts would result to the social and recreational experience of winter users of the LTVAs; no increase in law enforcement patrols at the LTVAs is anticipated.

Although it is possible that unauthorized use of these LTVAs could occur when they are closed from April 16 to September 14, it is unlikely because this area experiences extremely hot weather during the closed season.

In addition to BLM recreational facilities, there are regional and local recreational resources in the Project vicinity. Because the regional and local recreational facilities described in Section 3.2.12, *Recreation*, consist primarily of long-term camping facilities and supporting recreational uses, impacts to these resources would be similar to impacts to LTVAs described above. Depending on the number of authorized workers using the long-term camping facilities, use could affect the social setting or the physical infrastructure of these sites and/or the availability of short-term recreational uses due to increased demand.

Operations

Operation of the solar facility site and gen-tie line would require 12 full-time employees; therefore, it is anticipated that use of recreational facilities would be similar to the existing conditions.

Application of CEQA Significance Thresholds

REC-1) Would the Project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

The proposed Project would not involve the use of existing neighborhood or regional parks, or other recreational facilities. During construction, and for a shorter period of time during decommissioning, there would be a temporary increase in population that may utilize existing neighborhood or regional parks or other recreational facilities in the Project vicinity. The temporary (duration of construction) use of LTVAs may result in physical deterioration of the facilities. However, the LTVAs are designed with minimal facilities given that campers must use self-contained RVs and there are no assigned or designated sites. In addition, as described in Section 4.2.13, *Population, Housing, Public Services, Utilities, Growth-Inducing Impacts, and Socioeconomics*, it is assumed that most construction workers would utilize seasonal and vacation home rentals, which have high vacancy rates within the local study. Therefore, impacts to recreational facilities would be less than significant. During operation, the number of employees would be minimal and any potential impact on recreational facilities would be negligible; no impact would occur.

REC-2) Would the Project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

The proposed Project would result in negligible long-term increases in population. As a result, the Project would not require the construction or expansion of recreational facilities; no impact would occur.

REC-3) Would the Project be located within a Community Service Area[8] or recreation and park district with a Community Parks and Recreation Plan (Quimby fees)?

The proposed Project would not be within a Community Service Area and would not include recreational facilities. The Project would not add significantly to the local population necessitating the construction or expansion of recreational facilities, nor would it cause or accelerate physical deterioration of recreational facilities. No impact would occur.

Alternative 2: No Project Alternative

The No Project Alternative would result in no recreation-related or public access impacts because the Project would not be implemented; therefore, there would be no change to the existing use and no impacts would result.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 would result in the same requirements for temporary and permanent workforce, which would temporarily increase the utilization of recreational facilities in the Project vicinity, as well as require temporary rerouting of BLM open routes during construction. Therefore, Alternative 3 would have the same direct and indirect impacts on recreation and public access as Alternative 1.

[8] The Community Service Area described in Section 4.2.9, *Hydrology and Water Quality,* has a different definition than described in Section 4.2.14, *Recreation,* and is unrelated.

Application of CEQA Significance Thresholds

REC-1) Would Alternative 3 increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Alternative 3 would not involve the use of existing neighborhood or regional parks, or other recreational facilities. During construction, and for a shorter period of time during decommissioning, there would be a temporary increase in population that may utilize existing neighborhood or regional parks or other recreational facilities in the Project vicinity. LTVAs in particular may experience physical deterioration of the facilities. However, the LTVAs are designed with minimal facilities given that campers must use self-contained RVs and there are no assigned or designated sites. In addition, the use of these recreational facilities would be a temporary (duration of construction) impact. Furthermore, as described in Section 4.2.13, *Population, Housing, Public Services, Utilities, Growth-Inducing Impacts, and Socioeconomics,* vacancy rates within the local study area offer ample available housing to operational employees wishing to relocate to within the local study area. Therefore, impacts to recreational facilities would be less than significant. During operation, the number of employees would be minimal and any potential impact on recreational facilities would be negligible; no impact would occur.

REC-2) Would Alternative 3 include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Alternative 3 would result in negligible long-term increases in population. As a result, Alternative 3 would not require the construction or expansion of recreational facilities; no impact would occur.

REC-3) Would Alternative 3 be located within a Community Service Area or recreation and park district with a Community Parks and Recreation Plan (Quimby fees)?

Alternative 3 would not be within a Community Service Area and would not include recreational facilities. Alternative 3 would not add significantly to the local population necessitating the construction or expansion of recreational facilities, nor would it cause or accelerate physical deterioration of recreational facilities. No impact would occur.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Alternative 4 would result in the same requirements for temporary and permanent workforce, which would temporarily increase utilization of recreational facilities in the Project vicinity, as well as require temporary rerouting of BLM open routes during construction. Alternative 4 would have the same direct and indirect impacts on recreation and public access as Alternative 1.

Application of CEQA Significance Thresholds

REC-1) Would Alternative 4 increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Alternative 4 would not involve the use of existing neighborhood or regional parks, or other recreational facilities. During construction, and for a shorter period of time during decommissioning, there would be a temporary increase in population that may utilize existing neighborhood or regional parks or other recreational facilities in the Project vicinity. LTVAs in particular may experience physical deterioration of the facilities. However, the LTVAs are designed with minimal facilities given that campers must use self-contained RVs and there are no assigned or designated sites. In addition, the use of these recreational facilities would be a temporary (duration of construction) impact. Furthermore, as described in Section 4.2.13,

Population, Housing, Public Services, Utilities, Growth-Inducing Impacts, and Socioeconomics, vacancy rates within the local study area offer ample available housing to operational employees wishing to relocate to within the local study area. Therefore, impacts to recreational facilities would be less than significant. During operation, the number of employees would be minimal and any potential impact on recreational facilities would be negligible; no impact would occur.

REC-2) Would Alternative 4 include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Alternative 4 would result in negligible long-term increases in population. As a result, Alternative 4 would not require the construction or expansion of recreational facilities; no impact would occur.

REC-3) Would Alternative 4 be located within a Community Service Area or recreation and park district with a Community Parks and Recreation Plan (Quimby fees)?

Alternative 4 would not be within a Community Service Area and would not include recreational facilities. Alternative 4 would not add significantly to the local population necessitating the construction or expansion of recreational facilities, nor would it cause or accelerate physical deterioration of recreational facilities. No impact would occur.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary difference between Alternatives 1 and 5 is the absence of solar facility development north of I-10, which would reduce electrical output from a 485 MW down to a 315 MW alternating current solar PV facility. The Reduced Acreage Alternative would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). Alternative 5 would include approximately 2,403 acres for the solar field. Similar to the proposed Project, 73 acres would be utilized for the 230 kV gen-tie line. In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building and would have one access point (planned on Seeley Avenue). The Reduced Acreage Alternative would also no longer extend a 230 kV overhead gen-tie line from an on-site substation north of I-10, as this Alternative would not be developed on land north of I-10. Instead, this Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Approximately three miles of the gen-tie line would be within the solar facility. Alternative 5 would avoid impacts that would result from the construction, operation, maintenance, and decommissioning of a solar development north of I-10; however, the land on which Alternative 1 is proposed would continue with existing uses. Alternative 5 would not result in recreation-related or public access impacts caused by developments north of I-10 because Alternative 5 would not be implemented in this area; therefore, there would be no change to the existing use and no impacts would result north of I-10.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but not within the City limits of Blythe in comparison to the proposed Project. Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The construction, operation and decommissioning of Alternative 5 would not exceed those recreation impacts identified under the Alternative 1 analysis. Therefore, the Alternative 1 analysis would be applicable to Alternative 5, outside of those differences identified in the discussion below.

AR072467

Analysis of Direct and Indirect Impacts

Construction and Decommissioning

The Alternative 1 analysis for direct and indirect construction and decommissioning impacts would apply to Alternative 5. Similar to Alternative 1, the Alternative 5 gen-tie line that would extend outside the solar facility site would traverse NECO Plan Designated Open Routes 0660703, 660863, and 660862 and require temporary rerouting of BLM open routes during construction, but would not be fenced in during operation and maintenance. As the anticipated construction labor force would be slightly reduced under Alternative 5, there would be no additional impacts to regional BLM recreational facilities outside of those previously described under Alternative 1; as such, it is anticipated that there are sufficient long-term camping facilities nearby that could support the Alternative 5 workforce.

Operation and Maintenance

Operation and maintenance of the solar facility site and gen-tie line would require seven full-time employees; therefore, it is anticipated that use of recreational facilities would be similar to the existing conditions.

Application of CEQA Significance Thresholds

REC-1) Would Alternative 5 increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

The REC-1 analysis for Alternative 1 would apply to Alternative 5. As the anticipated construction labor force would be slightly reduced under Alternative 5, there would be no additional impacts to regional BLM recreational facilities outside of those previously described under Alternative 1; as such, it is anticipated that there are sufficient long-term camping facilities nearby that could support the Alternative 5 workforce. Furthermore, as described in Section 4.2.13, *Population, Housing, Public Services, Utilities, Growth-Inducing Impacts, and Socioeconomics*, vacancy rates within the local study area offer ample available housing to operational employees wishing to relocate to within the local study area. Therefore, impacts to recreational facilities would be less than significant. During operation, the number of employees would be minimal and any potential impact on recreational facilities would be negligible; no impact would occur.

REC-2) Would Alternative 5 include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Alternative 5 would result in negligible long-term increases in population. As a result, the Project would not require the construction or expansion of recreational facilities; no impact would occur.

REC-3) Would Alternative 5 be located within a Community Service Area or recreation and park district with a Community Parks and Recreation Plan (Quimby fees)?

Similar to Alternative 1, Alternative 5 would not be within a Community Service Area and would not include recreational facilities. Alternative 5 would not add significantly to the local population necessitating the construction or expansion of recreational facilities, nor would it cause or accelerate physical deterioration of recreational facilities. No impact would occur.

Cumulative Impacts

Geographic Scope

The geographic scope for recreational facilities includes other projects in the cumulative scenario, and in particular the other renewable energy projects listed in Table 4.1-1. These projects could result in similar demand for and use of long-term camping and other recreational facilities. In combination, the increased use of these resources due to the presence of authorized workers for the Project and cumulative projects could affect the social setting or the physical infrastructure of these sites.

Temporal Scope

The Project's authorized workers could use long-term camping facilities and their associated recreational amenities, primarily during construction and decommissioning activities.

Analysis of Direct and Indirect Impacts

Alternative 1 (Proposed Project)

Construction and Decommissioning

Construction of the present and reasonably foreseeable future projects may overlap with construction of the BMSP. Construction of the Devers-Palo Verde No. 2 transmission line, including the new SCE Colorado River Substation, is expected to be complete and in service by the third quarter of 2013, prior to anticipated commencement of Project construction in the fourth quarter of 2013. Construction of the BSPP, McCoy Solar Project, Palen Solar Power Project, Genesis Solar Energy Project, and Desert Sunlight Solar Farm may contribute to cumulative recreation impacts.

During construction and decommissioning activities, the cumulative project mentioned above and the proposed Project would temporarily increase the population that may utilize existing neighborhood or regional parks or other recreational facilities in the Project vicinity. Additionally, increased demand for other types of recreation resources and the displacement of dispersed recreation from the other projects' development footprints could reduce the availability of short-term recreational uses for other visitors to the area. However, the effects related to displacing dispersed recreation would be minor due to the low observed recreation on the Project area and at other projects' locations (impacts REC-1 through REC-3).

As discussed in Section 4.2.13, *Population, Housing, Public Services, Utilities, and Socioeconomics*, the communities closest to the proposed solar facility had very high residential vacancy rates in 2010. RV parks and campsites also are available as temporary housing. Available housing supply in the study area far exceeds conservative estimates of cumulative demand. It is anticipated that only a portion of the construction workforce from all cumulative projects mentioned above would utilize LTVA; therefore, impacts to LTVAs would be less than significant. It is anticipated that cumulative impacts from decommissioning would be similar to construction.

Operation and Maintenance

Operational labor needs of the reasonably foreseeable future projects and the Project are substantially smaller than construction labor needs and would not contribute to a cumulatively significant increase in demand for housing that exceeds available supply.

Alternative 2: No Project Alternative

Under the No Project Alternative, gen-tie facilities would not be constructed on BLM-managed lands and solar facilities would not be constructed on private lands. The public lands on the Project area would continue to be managed by BLM in accordance with existing land use designations in the CDCA Plan,

whereas the private lands would continue to be managed for agricultural production. Alternative 2 would not contribute to cumulative recreational impacts.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Construction and Decommissioning

Alternative 3 is similar to Alternative 1 (proposed Project), with the exception of the location of the Northern 230 kV gen-tie line, which would be approximately 700 feet north of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1.

During construction and decommissioning activities, the cumulative project mentioned above and the Alternative 3 would temporarily increase the population that may utilize existing neighborhood or regional parks or other recreational facilities in the Project vicinity. Additionally, increased demand for other types of recreation resources and the displacement of dispersed recreation from the other projects' development footprints could reduce the availability of short-term recreational uses for other visitors to the area. However, the effects related to displacing dispersed recreation would be minor due to the low observed recreation on the Project area and at other projects' locations (impacts REC-1 through REC-3).

As discussed in Section 4.2.13, *Population, Housing, Public Services, Utilities, and Socioeconomics*, the communities closest to the proposed solar facility had very high residential vacancy rates in 2010. It is anticipated that only a portion of the construction workforce from all cumulative projects mentioned above would utilize LTVA; therefore, impacts to LTVAs would be less than significant. The anticipated incremental effects of the construction of Alternative 3, when considered together with other past, present, and reasonably foreseeable future projects, would result in less than significant cumulative impacts to recreation. It is anticipated that cumulative impacts from decommissioning would be similar to construction.

Operation and Maintenance

Operational labor needs of the reasonably foreseeable future projects and Alternative 3 are substantially smaller than construction labor needs and would not contribute to a cumulatively significant increase in demand for housing that exceeds available supply or population. Therefore, impacts to recreation would be less than significant.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Construction and Decommissioning

Alternative 4 is similar to Alternative 1 (proposed Project), with the exception of the location of the Southern 230 kV gen-tie line, which would be approximately 0.8 mile south of Alternative 1's proposed 230 kV gen-tie line. The cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1.

During construction and decommissioning activities, the cumulative project mentioned above and Alternative 4 would temporarily increase the population that may utilize existing neighborhood or regional parks or other recreational facilities in the Project vicinity. Additionally, increased demand for other types of recreation resources and the displacement of dispersed recreation from the other projects' development footprints could reduce the availability of short-term recreational uses for other visitors to the area. However, the effects related to displacing dispersed recreation would be minor due to the low observed recreation on the Project area and at other projects' locations (impacts REC-1 through REC-3).

The communities closest to the proposed solar facility had very high residential vacancy rates in 2010. It is anticipated that only a portion of the construction workforce from all cumulative projects mentioned above would utilize LTVA; therefore, impacts to LTVAs would be less than significant. It is anticipated that cumulative impacts from decommissioning would be similar to construction.

The anticipated incremental effects of the construction of Alternative 4, when considered together with other past, present, and reasonably foreseeable future projects, would result in less than significant cumulative impacts to recreation. It is anticipated that cumulative impacts from decommissioning would be similar to construction.

Operation and Maintenance

Operational labor needs of the reasonably foreseeable future projects and Alternative 4 are substantially smaller than construction labor needs and would not contribute to a cumulatively significant increase in demand for housing that exceeds available supply.

Alternative 5: Reduced Acreage Alternative

Construction and Decommissioning

The cumulative recreation analysis for Alternative 1 would apply to Alternative 5. In comparison to Alternative 1, Alternative 5 would have peak monthly labor needs of 400 workers. The effects related to displacing dispersed recreation would be minor due to the low observed recreation on the Alternative 5 site and at other projects' locations, and the fact that the Project area is private property not available to public recreational uses. Available housing supply in the study area far exceeds conservative estimates of cumulative demand. There is an ample supply of housing units to accommodate temporary construction workers drawn from outside the study area. Therefore, it is anticipated that only a portion of the construction workforce from all cumulative projects mentioned above would utilize LTVA. Impacts to LTVAs would be less than significant. It is anticipated that cumulative impacts from decommissioning would be similar to construction.

Operation and Maintenance

Operational labor needs of the reasonably foreseeable future projects and Alternative 5 are substantially smaller than construction labor needs and would not contribute to a cumulatively significant increase in demand for housing that exceeds available supply.

Mitigation Measures

No mitigation measures are recommended.

Residual Impacts

No BMPs or mitigation measures are recommended. Impacts to Recreation would be less than significant.

NEPA Conclusions

The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged. The Project and each of the action Alternatives would involve only temporary impacts in terms of workers using recreational facilities during the three-year construction term and one-year decommissioning phase. Construction of the Project and Alternatives would include the use of LTVAs and may cause deterioration; however, they are designed with minimal facilities given that campers must use self-contained RVs and there are no assigned or designated sites. With minimal employees needed during the operational periods, impacts during operation would be negligible. The impacts, and contribution toward cumulative impacts, would be as described above (i.e., less than significant). The recreational uses would be subject to all laws, regulations, and policies covering desert recreation. Construction of utility-scale solar plants is anticipated in the CDCA Plan, and would also be consistent with the NECO Plan.

AR072471

4.2.15 Traffic and Transportation

This section describes conditions related to transportation and traffic and potential traffic impacts that would result from the construction, operation, maintenance, and decommissioning of the Project and Alternatives, as well as mitigation measures that would reduce or avoid adverse transportation and traffic effects. The analysis is based on the *Traffic Impact Study Report for the Blythe Mesa Solar Project* (KOA Corporation 2013) found in Appendix J.

Methodology for Analysis

The primary traffic and transportation impacts from the proposed Project and Alternatives are expected to occur during the short-term construction phase, as this phase would generate the greatest number of vehicle trips to the road network. Workers are expected to commute to work over local roads and I-10. Deliveries to and from the solar energy facilities are expected to be by truck; there are no intermodal facilities close to the Project area that would allow transport of materials by rail. This analysis focuses on potential impacts related to the construction, operation, maintenance, and decommissioning of the Project on the surrounding transportation systems and roadways. Impacts to local transportation systems were evaluated based on the level of service (LOS) determinations.

This assessment of transportation-related impacts is based on evaluations and technical analyses designed to compare the conditions without the Project and construction of the Project and Alternatives, as well as cumulative effects. Operation of the proposed Project would require 12 permanent full-time employees, which would not a substantial or considerable number of trips above those already generated by the exiting agricultural operations on the Project area. However, the construction phase of the Project would include trips generated by construction workers and supplies delivered by trucks to the Project area. Decommissioning activities are anticipated to be similar to construction, but less intense.

Project Construction Trip Generation Forecast

The Project is expected to generate a maximum of 20 truck deliveries per day for the 24-month peak construction period. Transport truck deliveries would include material deliveries and equipment. The calculations below account for heavier vehicle types (trucks) by converting truck trips to passenger car equivalents (PCEs), which are used in roadway capacity analysis to convert a mixed vehicle flow into an equivalent passenger car flow. This calculation is relevant to capacity and LOS determination, lane requirements, and determination of the effect of traffic on roadway operations.

In addition, the Project would employ a construction workforce of approximately 300 to 500 workers. Construction of the Project would take approximately 36 months, with peak construction occurring over a 24-month period. The Project would require an average construction workforce of 40 workers at the beginning of construction and a peak of 500 workers during the 24-month peak construction period of the solar array, substations, O&M buildings, and the 230 kV gen-tie line and fiber optic cable, with a tapering of fewer employees thereafter.

This Draft EIR/EA analysis considers that possibility that workers could travel about one hour in each direction to the Project area. It is likely that most of the construction workforce would be derived from communities located within Riverside County, which has the largest concentration of construction workers in proximity to the Project area. The majority of the projected construction workforce would likely seek housing closer to the Project area (within an hour driving distance) or seek temporary housing (such as seasonal, recreational, or occasional use housing; long-term visitor areas; and hotel and motels) during the week and commute home over the weekend. Therefore, based on the origin-location of construction workers commuting to and from the Project area, it is anticipated that 30 percent of the workers would originate from the west and 70 percent from the east. Although construction work hours would occur from 7:00 a.m. to 6:00 p.m., construction workers would commute to and from the Project area outside of the typical peak commute periods (7:00 a.m. to 9:00 a.m. and 4:00 p.m. to 6:00 p.m.). This analysis conservatively assumes all construction workers would commute during the aforementioned peak traffic periods.

Heavy equipment would be delivered via trucks, using Neighbours Boulevard from I-10 to the north and Riverside Drive and Seeley Avenue from the south. Based on the configuration of Project components within the solar facility site, it is anticipated that 60 percent of the traffic would use the Seeley Avenue access point and 40 percent of the traffic would use the Riverside Drive access point.

The Project would generate a total of 1,164 trips daily, including 429 trips during the a.m. peak hour and 429 trips during the p.m. peak hour. Table 4.2.14-1 lists the daily inbound and outbound trips that would result from peak construction during the a.m. and p.m. peak hours.

Table 4.2.14-1 Daily and Peak-Hour Trips During Peak Construction

	DAILY PCE	AM PEAK HOUR	PM PEAK HOUR
Employee Trips	884	400 inbound	400 outbound
Truck Trips	103	6 inbound	6 inbound
		5 outbound	5 outbound
Ancillary Trips	177	9 inbound	9 inbound
		9 outbound	9 outbound
Net Project Trips (PCEs)	**1,164**	**429 PCE**	**429 PCE**

Source: KOA 2013.
Note: peak hours do not coincide with the departure time of employees but, to be conservative, were included in the analysis

The identification of probable routes that would be utilized by the Project's construction traffic considered the originating location of the construction workforce, proposed land use, and surrounding regional access routes. The Project's regional construction traffic distribution on I-10 approaching Neighbours Boulevard is anticipated to include 70 percent approaching from the west and 30 percent approaching from the east. The Project's local traffic distribution would be approximately 60 percent of the construction traffic using the Seeley Avenue access point and 40 percent using the Riverside Avenue access point. As part of the proposed Project, the primary access routes (Seeley Avenue and Riverside Drive) would be improved for emergency vehicle access.

2015 Conditions

The Project's construction phase would produce the highest amount of traffic; the Project's operational traffic would be similar to existing conditions. Construction is anticipated to occur between 2013 and 2016, with the highest-intensity period occurring in 2014 and 2015. To ensure a conservative analysis that captures the Project's most intense traffic phase, and to ensure that the analysis does not understate the amount of traffic that would already be using the roadways at the time of that most intense phase, the year 2015 was selected as the traffic analysis year for purposes of measuring Project impacts.

In order to acknowledge regional traffic growth for the 2015 conditions, an ambient/background traffic growth rate was applied to the existing 2011 traffic volumes. Please refer to Chapter 3, Section 3.2.14, *Traffic and Transportation*, for a discussion regarding the existing (2011) traffic volumes. The ambient growth in the Project area is anticipated to increase at a rate of about two percent per year (see the County of Riverside's Scoping Agreement for the *Traffic Impact Study* found in Appendix J). Assuming a completion date within four years, these traffic counts were adjusted upward by eight percent to reflect area-wide growth expected to occur by 2015. Accordingly, the without-Project traffic referenced in the tables below includes the traffic measured in traffic counts, traffic generated by projects that are projected to be completed by 2015, and projects projected to be in construction by 2015. Traffic volumes may fluctuate from minute to minute within the peak periods. Therefore, a peak hour factor was added to the hourly traffic volumes and ambient growth, which simulates the higher 15-minute peak period volume for the entire peak period. The existing peak hour factor (ranging from 0.0 to 1.0) was obtained from existing traffic count information and applied to all intersections for the existing and 2015 Conditions.

CEQA Significance Criteria

The criteria used to determine the significance of the Project-related traffic and transportation impacts are based on the criteria identified in the CEQA Guidelines, Appendix G. Project-related impacts would be considered significant if they would:

TRA-1) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit.

TRA-2) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways; conflict with an applicable congestion management program, including, but not limited to, level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways.

TRA-3) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks; result in a change in air traffic levels or a change in location and result in substantial safety risks.

TRA-4) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

TRA-5) Result in inadequate emergency access.

TRA-6) Conflict with adopted policies, plans, or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

The following additional significance criteria from the County of Riverside Environmental Assessment form are used in the analysis. A project could have potentially significant impacts if it would:

TRA-7) Alter waterborne, rail or air traffic.

TRA-8) Cause an effect, or a need for new or altered maintenance of roads.

TRA-9) Cause an effect upon circulation during the project's construction.

TRA-10) Affect bike trails.

Level of Service Criteria

In addition to the CEQA Thresholds, an intersection LOS analysis was conducted to assess operational performance of the traffic study area (defined in Chapter 3, Section 3.2.14, *Transportation and Traffic*) during construction. For LOS, the applicable significance thresholds were based on Caltrans requirements, Riverside County Transportation Commission's (RCTC) 2011 Congestion Management Program (CMP), County of Riverside requirements, and City of Blythe requirements.

Caltrans has identified a target LOS at the transition between LOS C and LOS D on State highway facilities; however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS.

Riverside County's CMP specifies that all CMP roadways operate at an LOS threshold of E. Within the traffic study area, which includes four intersections (described in Chapter 3, Section 3.2.14, *Traffic and Transportation*), Neighbours Boulevard (State Route 78) has been identified as a key element of the CMP system. Based on the CMP, a significant traffic impact occurs: (1) when existing pre-Project LOS A, B, C, and D become LOS E or F with the Project; or (2) when the existing pre-Project LOS E becomes LOS F with the Project.

The Riverside County Circulation Element Policy C2.1 states that the County must maintain a target LOS C along County-maintained roads and conventional state highways. Therefore, a significant local impact to the County would occur if the pre-Project (base) LOS A, B, or C roadway became LOS D, E, or F. LOS E may be allowed in designated community centers to the extent that it would support transit-oriented development and walkable communities.

The City of Blythe strives to maintain LOS B on residential streets and LOS C or better on arterial and collector streets, at all intersections, and on principal arterials in the CMP during peak hours.

NEPA Requirements

The NEPA evaluation herein provides an analysis of potential direct and indirect effects on traffic and transportation provided within the same context of the CEQA significance criteria described above.

Applicable Best Management Practices

As part of the Project and Alternatives, the following applicable BMPs would minimize the environmental impacts to traffic and transportation. The full BMPs have been detailed below (see also Table 2-4 in Chapter 2) and are further referenced (by number) within the impact discussion.

NUMBER	BMP DESCRIPTION
BMP-4	**Fire Management and Protection Plan.** As required by existing law (Title 8 California Code of Regulations [CCR] Section 3221), a Fire Management and Protection Plan would be developed in consultation with the Riverside County Fire Department to identify potential hazards and accident scenarios that would exist at the facility during construction, operation, maintenance, and decommissioning of the Project. The Plan would include the identification of the following: potential fire hazards and ignition sources; proper handling and storage of potential fire hazards; control of potential ignition sources; persons responsible for equipment and systems maintenance; location of portable fire extinguishers; automatic sprinkler fire suppression system; water-spray fire system; coordination with local fire department; and recordkeeping requirements.
BMP-5	**Emergency Action Plan.** As required by Title 8 CCR Section 3220, the Project would develop a site-specific operations phase Emergency Action Plan. The operations Emergency Action Plan would address potential emergency situations requiring emergency response and/or planned evacuation. The plan would describe accident scenarios, evacuation routes, alarm systems, points of contact, assembly areas, responsibilities, and other actions to be taken in the event of an emergency. In particular, the plan would describe arrangements with local emergency response agencies.
BMP-14	**Travel and traffic.** Vehicular traffic on-site shall be confined to existing or designated travel routes and designated work areas. Access to the construction site and staging areas shall be limited to authorized vehicles and only through the designated roads. The extent of habitat disturbance during construction shall be reduced by keeping vehicles on access roads and minimizing foot and vehicle traffic through undisturbed areas. To the extent practical, travel shall be limited to stabilized roads. Road maintenance activities shall avoid blading existing forbs and grasses in ditches and adjacent to roads. Abandoned roads and roads no longer needed shall be subsoiled to increase infiltration and reduce soil compaction, then recontoured and revegetated. Construction traffic shall avoid unpaved surfaces to the extent practical (to reduce the risk of compaction) and reduce speed to lessen fugitive dust emissions. On unpaved or unstabilized surfaces within the construction site, speed limits (e.g., 20 mph) shall be posted with visible signs and enforced to minimize airborne fugitive dust. Project vehicle speeds shall be limited in areas occupied by special-status animal species. Traffic shall stop to allow wildlife to cross roads. Shuttle vans or carpooling shall be used to reduce the amount of traffic on access roads. Workers shall be trained to comply with the speed limit, use good engineering practices, minimize the drop height of materials, and minimize the number and extent of disturbed areas. The Project developer shall enforce these requirements.

NUMBER	BMP DESCRIPTION
BMP-15	**New access roads and parking lots.** New access roads shall be designed and constructed to the appropriate road design standards, such as those described in BLM Manual 9113 or County standards, whichever is applicable. New access roads shall be designed to follow natural land contours in the Project area and avoid existing desert washes. The specifications and codes developed by the U.S. Department of Transportation (DOT) and County of Riverside Transportation Department are also to be taken into account. Primary access roads and parking lots shall be surfaced with aggregate that is hard enough that vehicles cannot crush it and thus cause dust or compacted soil conditions. Paving may also be used on access roads and parking lots. Alternatively, chemical dust suppressants or durable polymeric soil stabilizers would be used on these locations.

Alternative 1: Proposed Project

Direct and Indirect Effects

Construction

The primary transportation impacts anticipated from the proposed Project would occur from commuting worker traffic along I-10, a regional traffic corridor, and local roads within the Project vicinity. I-10 is a four-lane highway in the vicinity of the proposed Project with a capacity of 8,000 vehicles per hour (Caltrans 2012). I-10 currently operates at LOS C east and west of Neighbours Blvd, also referred to as State Route 78 (BrightSource 2011). In 2015, with and without Project construction, it is anticipated that the same segment of I-10 would operate at LOS C (BrightSource 2011).

The traffic study area includes four intersections that were identified as having the potential for impacts to occur from the construction, operation, maintenance, and decommissioning of the proposed Project. Table 4.2.14-2 documents the 2015 Conditions and anticipated delays and LOS at each of the intersections with and without Project construction. All four intersections during the 2015 without Project scenario during the a.m. and p.m. peak hours would operate at LOS A. With the exception of Intersection 1 (Riverside Drive and Neighbours Boulevard), during the 2015 Conditions with Project construction all intersections would operate at LOS B during the a.m. and p.m. peak hours. LOS B represents reasonably free-flow operation where the ability to maneuver within the traffic stream is slightly restricted but still an acceptable condition. Intersection 1 (Riverside Drive and Neighbours Boulevard) during the a.m. peak hour would operate at LOS C, which represents a traffic flow near or at free-flow speed where the ability to maneuver through lanes is noticeably restricted and lane changes require more driver awareness; during the p.m. peak hour it would operate at LOS B. The County of Riverside has identified LOS C as acceptable along County-maintained roads and conventional state highways. The City of Blythe strives to maintain LOS B on residential streets and LOS C or better on arterial and collector streets, at all intersections, and on principal arterials in the CMP during peak hours. Therefore, all four intersections within the study area would operate at an acceptable LOS without or with the Project.

Construction of the proposed Project would generate additional traffic on regional and local roadways. Construction worker commute trips and equipment and materials deliveries would increase existing traffic volumes in the Project area.

As described above, Riverside County Circulation Element Policy C2.1 states that the County must maintain a Countywide Target LOS C along County-maintained roads and conventional state highways, except that:

- LOS D may be allowed in Community Development area, only at intersections of any combination of Secondary Highways, Major Highways, Arterials, Urban Arterials, Expressways, conventional state highways or freeway ramp intersections.
- LOS E may be allowed in designated community centers to the extent that it would support transit-oriented development and walkable communities.

As such, impacts to roadways would occur when the addition of Project traffic causes roadway operations to degrade from an acceptable level (LOS C or better) to an unacceptable level (LOS D or worse). Intersections under joint jurisdiction with Caltrans may operate at an LOS of E.

As shown below in Table 4.2.14-2, the addition of Project construction-related traffic to the regional roadway network is expected to increase the delay at all intersections by 1.1 to 7.4 seconds and the LOS of these intersections would remain within the County target of LOS C or better. Drivers along these roadways would not be expected to experience substantial noticeable delays with the addition of Project-related construction traffic.

Table 4.2.14-2 2015 Conditions

INTERSECTION	WITHOUT PROJECT CONSTRUCTION		WITH PROJECT CONSTRUCTION		DELAY (SECONDS)	SIGNIFICANT UNDER CEQA
	Delay (seconds)	LOS	Delay (seconds)	LOS		
AM Peak Hour						
1. Riverside Dr & Neighbours Blvd*	9.0	A	16.4	C	7.4	No
2. I-10 WB Ramp & Neighbours Blvd*	9.0	A	11.1	B	2.1	No
3. I-10 EB Ramp & Neighbours Blvd*	9.2	A	11.2	B	2.0	No
4. Seeley Ave & Neighbours Blvd*	9.5	A	10.6	B	1.1	No
PM Peak Hour						
1. Riverside Dr & Neighbours Blvd*	8.6	A	10.2	B	1.6	No
2. I-10 WB Ramp & Neighbours Blvd*	9.5	A	12.5	B	3.0	No
3. I-10 EB Ramp & Neighbours Blvd*	9.6	A	13.8	B	4.2	No
4. Seeley Ave & Neighbours Blvd*	9.9	A	12.9	B	3.0	No

Source: KOA 2013.
Note: *Unsignalized Intersection; WB – westbound; EB – eastbound.

Project-generated traffic, especially heavy truck traffic, would accelerate the rate of deterioration of public roads traveled. The contribution of the proposed Project to road deterioration would be negligible on I-10 because Project-generated traffic would be a small portion of total traffic. However, effects on local roads could be more pronounced. Effects would be reduced with implementation of Mitigation Measure Traffic-2, which would require the Project owner to restore roads to pre-construction conditions. Levels of congestion (delay) at on- and off-ramps along I-10 could be adversely affected due to the temporary influx of construction-related traffic; however, even a worst-case scenario would not likely exceed the capacity of I-10, which in this area has two lanes in both directions to accommodate the anticipated increase in traffic while maintaining adequate traffic flow along the freeway.

Pedestrian and Bicycles

As described in Chapter 3, Section 3.2.14, *Traffic and Transportation,* pedestrian facilities and bicycle lanes do not exist throughout the proposed Project study area. The existing pedestrian network does not provide sidewalks connecting adjoining land uses along Neighbours Boulevard, Riverside Drive, and Seeley Avenue.

Transit and Rail

The Palo Verde Valley Transit Agency (PVVTA) operates Routes 3, 4, and 5 along Neighbours Boulevard north and south of I-10. Routes 3, 4, and 5 travel along Hobson Way, which passes through the Project location and heads west towards Mesa Verde. There is a stop adjacent to the Project at the intersection of Hobson Way and Buck Boulevard. Routes 3 and 5 run along Neighbours Boulevard towards Ripley, with stops on the corner of Hobson Way and 14th Avenue along Neighbours Boulevard. The Project would

AR072477

not directly affect the ability of the PVVTA to use any of their existing routes or stops since road closures and detours are not anticipated for this Project.

The Arizona and California Railroad is approximately five miles from the Project area; however, it does not service the Blythe area. Therefore, construction of the Project would not impact rail service.

Airport Service

Blythe Airport is a public airport, approximately 0.5 mile west of the proposed Project that serves Riverside County. The Blythe Airport does not have regularly scheduled passenger service, and delivery of construction materials is expected to occur by truck; therefore, construction of the Project would not result in an increase in airport service. Additionally, the Project would not utilize equipment that would create obstructions or impact operations at the Blythe Airport. For potential impacts to Blythe Airport operations regarding reflection and glare and hazards, please refer to Section 4.2.1, *Aesthetics*, and Section 4.2.8, *Hazards and Hazardous Materials*.

Parking

Construction workers would park personal vehicles on-site, where adequate parking space would be provided. The anticipated construction activities would not eliminate any existing parking spaces and result in parking deficiencies. Heavy equipment would be parked and maintained at construction sites, and all utility trucks would park in the construction yards. There would be sufficient parking for all employees, visitors, service vehicles, and contractors on-site during the construction, operation and maintenance, and decommissioning of the Project.

School

Construction truck traffic may have some effect on school children in the area (children being picked up or dropped off on local roads near the proposed Project area). Students utilizing the I-10, Neighbours Boulevard, and Hobson Way may experience delays. However, construction hours would be 7:00 a.m. to 6:00 p.m., and workers are projected to commute generally before and after normal school hours.

Emergency Access

The Project would not require any road closures or result in impacts to emergency vehicles; however, Seeley Avenue and Riverside Drive would be improved for emergency vehicle access. Construction traffic would be confined to designated travel routes (BMP-14). Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Therefore, impacts to emergency vehicles would be minimized.

With the addition of Project construction traffic, all intersections and roadways segments analyzed would operate at acceptable service levels (LOS C or better). Therefore, construction traffic would not result in adverse effects to access to the proposed Project area (including movement of emergency vehicles) or nearby land uses.

Conflict with Applicable Congestion Management Program or other Plans and Policies

The Regional Transportation Plan (RTP) is a multi-modal, long-range planning document prepared by the Southern California Association of Governments (SCAG), in coordination with federal, State, and other regional, subregional, and local agencies in Southern California. The RTP includes programs and policies for congestion management, transit, bicycles and pedestrians, roadways, freight, and finances. The Riverside County CMP was established to more directly link land use, transportation, and air quality and to prompt reasonable growth management programs that would more effectively utilize new and existing transportation funds, alleviate traffic congestion and related impacts, and improve air quality. The

proposed Project involves construction of a renewable energy generation facility that would not involve construction of new transportation facilities or substantial alteration of existing transportation facilities. There are no pedestrian or public transit facilities in the vicinity of the proposed Project. As discussed above, Project construction traffic would not reduce the LOS of area facilities below LOS C. Therefore, the Project would not conflict with the applicable RTP or CMP.

Operation

Operation of the Project would require 12 permanent full-time employees, which would not generate a significant number of trips above existing agricultural operations on the Project area. Impacts to the existing transportation network are not anticipated.

The Project would be approximately 0.5 mile from the Blythe Airport and may create potential glare impacts and obstructions from the 230 kV gen-tie line to the Blythe Airport. Although solar panels are designed to absorb the sunlight, the panels have the potential to cause glare/reflection impacts to the Blythe Airport. Please refer to Section 4.2.1, *Aesthetics, Visual Resources, and Reflection*, for a discussion regarding glare impacts to the Blythe Airport operations. For a discussion regarding potential hazards and obstructions that would result from the operation of the 230 kV gen-tie line, please refer to Section 4.2.8, *Hazards and Hazardous Materials*.

Decommissioning

At the end of the Project's useful life, it would require decommissioning. Decommissioning activities would include removal of the solar facility and dismantling of the 230 kV gen-tie. These activities would require similar types of equipment and a workforce that is similar to construction, but would be less than that of peak construction. It is anticipated that traffic and transportation impacts from decommissioning activities would be similar but less intense to that of construction.

Application of CEQA Significance Thresholds

TRA-1) Would the Project conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

The proposed Project would not conflict with the Riverside County CMP, Regional Comprehensive Plan and RTP, County of Riverside General Plan, and City of Blythe General Plan in regards to applicable plans, ordinances, or policies establishing measures of effectiveness for the performance of the circulation system. With construction of the proposed Project, I-10 would operate at LOS C and all study intersections would operate at LOS B or C, which does not exceed the thresholds established in the aforementioned plans. Implementation of BMPs -4, -5, -14, and -15 would minimize impacts to transportation and traffic. Implementation of Mitigation Measures Traffic-1 through Traffic-3 would reduce impacts to less than significant. The operational Project impacts are expected to be nominal. Project construction and decommissioning would not have long-term significant traffic impacts on the transportation network, since construction- and decommissioning-related impacts are considered temporary.

TRA-2) Would the Project exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways; conflict with an applicable congestion management program, including, but not limited to, level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

The RCTC's adopted minimum LOS threshold is LOS E. Therefore, when a CMP street or highway segment falls to LOS F, a deficiency plan must be required. Construction of the

proposed Project would reduce the existing LOS A to LOS B or C for the four study intersections. Therefore, the Project would not conflict with an applicable congestion management program including, but not limited to, LOS standards and travel demand measures or other standards established by the county congestion management agency for designated roads or highways. Operational Project impacts to traffic would be nominal. Impacts would be less than significant.

TRA-3) Would the Project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks; result in a change in air traffic levels or a change in location and result in substantial safety risks?

The Project would not result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks. Construction equipment that would be utilized for the Project would not obstruct the navigable air space. No impacts would occur.

TRA-4) Would the Project substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

The Project would not result in substantially increased hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). Refer to Section 4.2.1, *Aesthetics, Visual Resources, and Reflection*, for a discussion regarding potential glare impacts related to the solar panels. For impacts related to potential hazards and obstructions to Blythe Airport operations that would result from the operation of the 230 kV gen-tie line, refer to Section 4.2.8, *Hazards and Hazardous Materials*. The Project would not result in incompatible uses with adjacent or nearby agricultural operations (refer to Section 4.2.2, *Agriculture*). Impacts would be less than significant.

TRA-5) Would the Project result in inadequate emergency access?

The Project would not result in inadequate emergency access. No road closures are anticipated for the Project; however, Seeley Avenue and Riverside Drive would be improved for emergency vehicle access. Construction traffic would be confined to designated travel routes (BMP-14). Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Implementation of BMPs would minimize impacts to emergency access. Accordingly, impacts to emergency access would be less than significant.

TRA-6) Conflict with adopted policies, plans, or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

The Project would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities. The Project area does not contain bicycle or pedestrian facilities. Because it is in an area surrounding by agricultural uses, proposed and approved solar power plants, and the airport, which lie miles apart, bicycles and walking are not a major means of transportation and substantial bicycle or pedestrian use is not projected in the future. Accordingly, the Project would not interfere with bicycle or pedestrian safety. As shown in Table 4.2.14-2, construction traffic would increase delays at the four intersections (approximately 16.4 seconds at Intersection 1; 11.1 seconds at Intersection 2; and 11.2 seconds at Intersection 3). The PVVTA operates Routes 3, 4, and 5 along Neighbours Boulevard north and south of I-10and it is anticipated that buses would experience the delays mentioned above. Therefore, impacts to public transit would be less than significant.

TRA-7) Would the Project alter waterborne, rail or air traffic?

The Project would not alter waterborne, rail, or air traffic. The Project would not utilize waterborne, rail, or air services to transport materials or the workforce; therefore, no impacts to waterborne, rail or air traffic would occur.

TRA-8) Would the Project cause an effect, or a need for new or altered maintenance of roads?

The Project would improve Seeley Avenue and Riverside Drive; however, these roads are currently maintained by the County of Riverside and would not cause an effect or need for new or altered maintenance of roads. The construction and operation of the gen-tie line would utilize the existing transmission line access roads and maintenance of roads would be similar to existing conditions. No impacts would occur.

TRA-9) Would the Project cause an effect upon circulation during the project's construction?

The Project would adversely affect circulation during the Project's construction; however, such effects would be less than significant.

TRA-10) Would the Project affect bike trails?

The Project would not adversely affect bike trails.

Alternative 2: No Project Alternative

Under the No Project Alternative, gen-tie facilities would not be constructed on BLM-managed lands and solar facilities would not be constructed on private lands. The public lands in the Project area would continue to be managed by BLM in accordance with existing land use designations in the CDCA Plan, whereas the private lands would continue to be managed for agricultural production. Alternative 2 would not contribute to traffic and transportation impacts.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. Alternative 3 would shift the gen-tie line to the north relative to the proposed Project's gen-tie line. Although the Alternative 3 gen-tie line would be slightly longer than the proposed Project's gen-tie line, activities associated with construction, operation, maintenance, and decommissioning of this Alternative would have the same impacts as Alternative 1.

Application of CEQA Significance Thresholds

TRA-1) Would Alternative 3 conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Alternative 3 would not conflict with the Riverside County CMP, Regional Comprehensive Plan and RTP, County of Riverside General Plan, and City of Blythe General Plan in regards to applicable plans, ordinances, or policies establishing measures of effectiveness for the performance of the circulation system. With construction of Alternative 3, I-10 would operate at LOS C and all study intersections would operate at an LOS B or C, which does not exceed the thresholds established in the aforementioned plans. The operational Alternative 3 impacts are expected to be nominal. Alternative 3 construction and decommissioning would not have long-term significant traffic impacts on the transportation network, since construction- and decommissioning-related impacts are considered temporary. Implementation of BMPs would minimize impacts to traffic and transportation. With implementation of Mitigation Measures

Traffic-1 through Traffic-3, impacts to the circulation system and potential conflicts with applicable plans, ordinances, and policies would be less than significant.

TRA-2) Would Alternative 3 exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways; conflict with an applicable congestion management program, including, but not limited to, level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

For the four study intersections, construction of Alternative 3 would reduce the existing LOS A to LOS B or C, but would not exceed the RCTC's adopted threshold of LOS E. Therefore, Alternative 3 would not conflict with an applicable congestion management program including, but not limited to, LOS standards and travel demand measures or other standards established by the county congestion management agency for designated roads or highways. Operational Alternative 3 impacts to traffic would be nominal. Impacts would be less than significant.

TRA-3) Would Alternative 3 result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks; result in a change in air traffic levels or a change in location and result in substantial safety risks?

Alternative 3 would not result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks. Construction equipment that would be utilized for the Project would not obstruct the navigable air space. No impacts would occur.

TRA-4) Would Alternative 3 substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Alternative 3 would not result in substantially increased hazards due to a design feature or incompatible uses. No impacts would occur.

TRA-5) Would Alternative 3 result in inadequate emergency access?

Alternative 3 would not result in inadequate emergency access. No road closures are anticipated for the Project; however, Seeley Avenue and Riverside Drive would be improved for emergency vehicle access. Construction traffic would be confined to designated travel routes (BMP-14). Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Therefore, impacts to emergency access would be minimized. Impacts would be less than significant.

TRA-6) Would Alternative 3 conflict with adopted policies, plans, or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Alternative 3 would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities. The Project area does not contain bicycle or pedestrian facilities. Because it is in an area surrounding by agricultural uses, proposed and approved solar power plants, and the airport, which lie miles apart, bicycles and walking are not a major means of transportation and substantial bicycle or pedestrian use is not projected in the future. Accordingly, Alternative 3 would not interfere with bicycle or pedestrian safety. As shown in Table 4.2.14-2, construction traffic would increase delays at the four intersections (approximately 16.4 seconds at Intersection 1; 11.1 seconds at Intersection 2; and 11.2 seconds at Intersection 3). The PVVTA operates Routes 3, 4, and 5 along Neighbours Boulevard north and south of I-10and it is

anticipated that buses would experience the delays mentioned above. Therefore, impacts to public transit would be less than significant.

TRA-7) Would Alternative 3 alter waterborne, rail or air traffic?

Alternative 3 would not alter waterborne, rail, or air traffic. Alternative 3 would not utilize waterborne, rail, or air services to transport materials or the workforce; therefore, no impacts to waterborne, rail, or air traffic would occur.

TRA-8) Would Alternative 3 cause an effect, or a need for new or altered maintenance of roads?

Alternative 3 would not cause an effect or need for new or altered maintenance of roads. The construction and operation of the gen-tie line would utilize the existing transmission line access roads and maintenance of roads would be similar to existing conditions. No impacts would occur.

TRA-9) Would Alternative 3 cause an effect upon circulation during Alternative 3's construction?

Alternative 3 would adversely affect circulation during construction; however, impacts would be less than significant.

TRA-10) Would Alternative 3 affect bike trails?

Alternative 3 would not adversely affect bike trails.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Alternative 4 would be similar to Alternative 1, with the exception of the location of the proposed 230 kV gen-tie line. The Alternative 4 gen-tie line would be shifted to the south relative to the proposed Project's gen-tie line. The portion of the 230 kV gen-tie line that would extend from the solar facility to the Colorado River Substation, approximately three miles of the Southern 230 kV Alternative, would not parallel existing transmission lines and would require construction of new access roads for the construction and operation of the gen-tie line. Although the Alternative 4 gen-tie line would be slightly longer than the proposed Project's gen-tie line, activities associated with construction, operation, maintenance, and decommissioning of Alternative 4 would have similar impacts on traffic and transportation as Alternative 1 (proposed Project).

Application of CEQA Significance Thresholds

TRA-1) Would Alternative 4 conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Alternative 4 would not conflict with the Riverside County CMP, Regional Comprehensive Plan and RTP, County of Riverside General Plan, and City of Blythe General Plan in regards to applicable plans, ordinances, or policies establishing measures of effectiveness for the performance of the circulation system. With construction of Alternative 4, I-10 would operate at LOS C and all study intersections would operate at an LOS B or C, which does not exceed the thresholds established in the aforementioned plans. The operational Alternative 4 impacts are expected to be nominal. Alternative 4 construction and decommissioning would not have long-term significant traffic impacts on the transportation network, since construction- and decommissioning-related impacts are considered temporary. Implementation of BMPs would minimize impacts to traffic and transportation. Implementation of Mitigation Measures Traffic-1 through Traffic-3 would reduce impacts to less than significant levels.

TRA-2) Would Alternative 4 exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways; conflict with an applicable congestion management program, including, but not limited to, level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

For the four study intersections, construction of Alternative 4 would reduce the existing LOS A to LOS B or C, but would not exceed the RCTC's adopted threshold of LOS E. Therefore, Alternative 4 would not conflict with an applicable congestion management program including, but not limited to, LOS standards and travel demand measures or other standards established by the county congestion management agency for designated roads or highways. Operational Alternative 4 impacts to traffic would be nominal. Impacts would be less than significant.

TRA-3) Would Alternative 4 result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks; result in a change in air traffic levels or a change in location and result in substantial safety risks?

Alternative 4 would not result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks. Construction equipment that would be utilized for the Project would not obstruct the navigable air space. No impacts would occur.

TRA-4) Would Alternative 4 substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Alternative 4 would not result in substantially increased hazards due to a design feature or incompatible uses. No impacts would occur.

TRA-5) Would Alternative 4 result in inadequate emergency access?

Alternative 4 would not result in inadequate emergency access. No road closures are anticipated for the Project; however, Seeley Avenue and Riverside Drive would be improved for emergency vehicle access. Construction traffic would be confined to designated travel routes (BMP-14). Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Implementation of BMPs would minimize impacts to emergency access. Impacts to emergency access would be less than significant.

TRA-6) Would Alternative 4 conflict with adopted policies, plans, or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Alternative 4 would not conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities. The Project area does not contain bicycle or pedestrian facilities. Because it is in an area surrounding by agricultural uses, proposed and approved solar power plants, and the airport, which lie miles apart, bicycles and walking are not a major means of transportation and substantial bicycle or pedestrian use is not projected in the future. Accordingly, Alternative 4 would not interfere with bicycle or pedestrian safety. As shown in Table 4.2.14-2, construction traffic would increase delays at the four intersections (approximately 16.4 seconds at Intersection 1; 11.1 seconds at Intersection 2; and 11.2 seconds at Intersection 3). The PVVTA operates Routes 3, 4, and 5 along Neighbours Boulevard north and south of I-10and it is anticipated that buses would experience the delays mentioned above. Therefore, impacts to public transit would be less than significant.

AR072484

TRA-7) Would Alternative 4 alter waterborne, rail or air traffic?

Alternative 4 would not alter waterborne, rail, or air traffic. Alternative 4 would not utilize waterborne, rail, or air services to transport materials or the workforce; therefore, no impacts to waterborne, rail, or air traffic would occur.

TRA-8) Would Alternative 4 cause an effect, or a need for new or altered maintenance of roads?

Alternative 4 would require the construction of new access roads for the construction, operation, and maintenance of approximately three miles of the gen-tie line that would extend outside of the solar facility to the Colorado River Substation. The remaining portions of the 230 kV gen-tie line would parallel existing transmission lines and would utilize the existing access roads. Maintenance of these access roads would be similar to existing conditions. Impacts would be less than significant.

TRA-9) Would Alternative 4 cause an effect upon circulation during Alternative 3's construction?

Alternative 4 would temporarily impact circulation during construction; however, impacts would be less than significant.

TRA-10) Would Alternative 4 affect bike trails?

Alternative 4 would not adversely affect bike trails.

Alternative 5: Reduced Acreage Alternative

Similar to Alternative 1, Alternative 5 would include the construction, operation, maintenance, and decommissioning of a solar facility and associated infrastructure. The primary differences between Alternatives 1 and 5 are the absence of solar facility development north of I-10 and that Alternative 5 would be on a reduced footprint of approximately 2,476 acres (from 3,660 acres for the proposed Project). In comparison to Alternative 1, Alternative 5 would eliminate one on-site substation and one O&M building and would have one access point (planned on Seeley Avenue). The Reduced Acreage Alternative would construct an approximately 7.8-mile-long, 230 kV overhead gen-tie line from the proposed on-site substation south of I-10 to the approved Colorado River Substation. Alternative 5 would avoid impacts that would result from the construction, operation, maintenance, and decommissioning of a solar development north of I-10; however, the land on which Alternative 1 is proposed would continue with existing uses.

The Reduced Acreage Alternative solar facility and a portion of the gen-tie line would be within the jurisdiction of the County of Riverside but not within the City limits of Blythe in comparison to the proposed Project. Alternative 5 would need to comply with the RCGP (2003) and PVVAP (2008). The remaining portion of the gen-tie line would traverse lands managed by the BLM and would need to comply with the CDCA Plan. The daily PCEs for Alternative 5 would 953, which is less than that of Alternative 1's (Proposed Project) daily PCEs of 1,164, However, the study intersection of Riverside Drive and Neighbours Boulevard would not be by Alternative 5; therefore, the construction traffic directed south of I-10 rather than north of I-10traffic to remaining three study intersections and would slightly increases to traffic volumes during the construction and decommissioning phase under Alternative 5 in comparison to Alternative 1. Table 4.2.14-2, 2015 Conditions, illustrates that Intersection 2 through Intersection 4, during the a.m. and p.m. peak hours for Alternative 1 are operating at an LOS B with Project construction. It is assumed that this slight increase for Alternative 5 during the construction phase would not degrade traffic volumes from an acceptable level (LOS C or better) to an unacceptable level (LOS D or worse). The operation of Alternative 5 would not exceed those traffic impacts identified under the Alternative 1 analysis.

AR072485

Direct and Indirect Effects

Construction

Similar to Alternative 1, the primary transportation impacts anticipated from Alternative 5 would occur from commuting worker traffic along I-10, a regional traffic corridor, and local roads within the Alternative 5 vicinity. The Alternative 1 traffic study area included four intersections that were identified as having the potential for impacts to occur from the construction, operation, maintenance, and decommissioning of the proposed Project. Construction of the proposed Project as well as the Reduced Acreage Alternative would generate additional traffic on regional and local roadways. Construction worker commute trips and equipment and materials deliveries would increase existing traffic volumes in the area. Under Alternative 1, all intersections were anticipated to operate at LOS B or C during the a.m. peak hour (Table 4.2.14-1), which represents reasonably free-flow operation where the ability to maneuver within the traffic stream is slightly restricted but still an acceptable condition. In addition, under Alternative 1, during the p.m. peak hour, all four study intersections would operate at LOS B.

As detailed in the Alternative 1 analysis, the County of Riverside has identified LOS C as acceptable along County-maintained roads and conventional state highways. The City of Blythe strives to maintain LOS B on residential streets and LOS C or better on arterial and collector streets, at all intersections, and on principal arterials in the CMP during peak hours. As such, impacts to roadways would occur when the addition of Alternative 5 construction traffic causes roadway operations to degrade from an acceptable level (LOS C or better) to an unacceptable level (LOS D or worse). Intersections under joint jurisdiction with Caltrans may operate at an LOS of E.

Under the traffic analysis for Alternative 1, it was assumed that approximately 60 percent of construction workers would drive alone and 40 percent would carpool. Given this same assumption under Alternative 5, 240 would drive alone and 160 would carpool. Assuming truck deliveries stay same under Alternative 5 in comparison to the proposed Project, and ancillary trips are calculated the same way, the approximate temporary construction trip generation would be as follows.

Table 4.2.14-3 Alternative 5 Daily Construction Trip Generation

TYPES OF TRIPS	DAILY PCE	AM PEAK HOUR			PM PEAK HOUR		
		Total	In	Out	Total	In	Out
Employee Trips	708	320	320	0	320	0	400
Truck Trips	103	11	6	5	11	6	5
Ancillary Trips	142	15	7	8	15	7	8
Net Project Trips (PCEs)	**953**	**346**	**333**	**13**	**346**	**13**	**413**

Source: KOA 2013.

As no solar facility development would occur north of I-10 under Alternative 5, traffic would not impact study Intersection 1 (Riverside Drive and Neighbours Boulevard); however, Intersection 2 (Neighbours Boulevard and I-10 Westbound Ramp) would still be affected. The delay for the intersection would have the potential to increase under Alternative 5 development, as the increased turn volumes for left turns could increase the delay at this location. The westbound ramp would likely have a higher volume off the ramp during the a.m. peak hour at the stop, causing a higher delay as well as a higher queue build-up under Alternative 5. This would also occur for the eastbound ramp. Under Alternative 5, the intersection of Neighbours Boulevard and Seeley Avenue would have an increased delay compared to Alternative 1 due to an increase in construction traffic volume routed south. Although Alternative 5 construction-related traffic would result in comparatively increased traffic volumes and delays to the above-mentioned intersections, it is not expected to increase volumes and delay to unacceptable levels. Similar to Alternative 1, drivers along these roadways would not be expected to experience noticeable delays with the addition of Alternative 5-related construction traffic. With construction of Alternative 5, similar to the proposed Project, it is anticipated that I-10 would operate at LOS C.

Pedestrian and Bicycles

The Alternative 1 analysis would apply to Alternative 5, therefore construction activities associated with Alternative 5 would not adversely affect any pedestrian or bicycle facilities.

Transit and Rail

The PVVTA operates Routes 3, 4, and 5 along Neighbours Boulevard north and south of I-10. Although no development would occur north of I-10 under Alternative 5, the Alternative 1 analysis would apply to Alternative 5 and the Project would not directly affect the ability of the PVVTA to use any of their existing routes or stops since road closures and detours are not anticipated.

Airport Service

Although development would occur south of I-10, farther from Blythe Airport, the Alternative 1 analysis would apply to Alternative 5, and construction activities associated with Alternative 5 would have no affect on airport service.

Parking

The reduced footprint under Alternative 5 would not alter the conclusions found under Alternative 1; as such, the Alternative 1 analysis would apply to Alternative 5 and there would be sufficient parking for all employees, visitors, service vehicles, and contractors on-site during the construction, operation and maintenance, and decommissioning of Alternative 5.

School

As no development would occur north of I-10, the construction truck traffic would be diverted south under Alternative 5. Under the Reduced Acreage Alternative, students utilizing I-10, Neighbours Boulevard, and Hobson Way would not experience delays. In addition, construction hours would be 7:00 a.m. to 6:00 p.m., and workers are projected to commute generally before and after normal school hours.

Emergency Access

Similar to Alternative 1, Alternative 5 would not require any road closures or result in impacts to emergency vehicles; however, in contrast, Riverside Drive would not be improved for emergency vehicle access. Construction traffic would be confined to designated travel routes (BMP-14). Mesa Drive would not be utilized for the construction or operation of the Project, but for emergency access only. Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Therefore, impacts to emergency vehicles would be minimized.

As previously concluded, although Alternative 5 construction-related traffic would result in comparatively increased traffic volumes and delays to the above-mentioned intersections, it is not expected to increase volumes and delay to unacceptable levels above those anticipated under Alternative 1. All intersections would operate at acceptable levels. Therefore, construction traffic would not result in adverse effects to access to the Alternative 5 site (including movement of emergency vehicles) or nearby land uses.

Conflict with Applicable Congestion Management Program or other Plans and Policies

The analysis under Alternative 1 would apply to Alternative 5.

Operation

Operation of Alternative 5 would require seven permanent full-time employees, which would not generate a significant number of trips above existing volumes. Impacts to the existing transportation network are not anticipated.

Alternative 5 would not create significant glare impacts and obstructions from the solar facility and the 230 kV gen-tie line to the Blythe Airport. Please refer to Section 4.2.1, *Aesthetics, Visual Resources, and Reflection*, for a discussion regarding glare impacts to the Blythe Airport operations. For a discussion regarding potential hazards and obstructions that would result from the operation of the 230 kV gen-tie line, please refer to Section 4.2.8, *Hazards and Hazardous Materials*.

Decommissioning

The analysis for Alternative 1 would apply to Alternative 5.

Application of CEQA Significance Thresholds

TRA-1) Would Alternative 5 conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Alternative 5 would not conflict with the Riverside County CMP, Regional Comprehensive Plan and RTP, or County of Riverside General Plan in regards to applicable plans, ordinances, or policies establishing measures of effectiveness for the performance of the circulation system. Since Alternative 5 would utilize a similar number of construction workers as Alternative 1, it is anticipated that I-10 would operate at LOS C, and all studied intersections would operate at acceptable levels and would not exceed the thresholds established in the aforementioned plans. Implementation of BMPs -4, -5, -14, and -15 would minimize impacts to traffic and transportation. With implementation of Mitigation Measures Traffic-1 through Traffic-3, impacts would be reduced to less than significant. Alternative 5 construction and decommissioning would not have long-term significant traffic impacts on the transportation network, since construction- and decommissioning-related impacts are considered temporary.

TRA-2) Would Alternative 5 exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways; conflict with an applicable congestion management program, including, but not limited to, level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

The RCTC's adopted LOS threshold is LOS E. Therefore, when a CMP street or highway segment falls to LOS F, a deficiency plan must be required. For the impacted intersections, construction of Alternative 5 would reduce the existing LOS. However, these reductions would not fall into unacceptable levels. Therefore, Alternative 5 would not conflict with an applicable congestion management program including, but not limited to, LOS standards and travel demand measures or other standards established by the county congestion management agency for designated roads or highways. Operational impacts to traffic would be nominal. Any potential impacts would be less than significant.

TRA-3) Would Alternative 5 result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks; result in a change in air traffic levels or a change in location and result in substantial safety risks?

Similar to Alternative 1, Alternative 5 would not result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks. Construction equipment that would be utilized for Alternative 5 would not obstruct the navigable air space. No impacts would occur.

TRA-4) Would Alternative 5 substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

The TRA-4 analysis for Alternative 1 would apply to Alternative 5.

TRA-5) Would Alternative 5 result in inadequate emergency access?

Similar to Alternative 1, Alternative 5 would not require any road closures or result in impacts to emergency vehicles; however, in contrast, Riverside Drive would not be improved for emergency vehicle access. Construction traffic would be confined to designated travel routes (BMP-14). The Riverside County Operational Area Emergency Operations Plan (RCFD 2006) does not designate emergency evacuation routes; therefore, construction would not impair implementation of, or physically interfere with, an adopted emergency response or evacuation plan. Local roads are unlikely to be used as emergency routes because of the remote location of the site. The main access road to the solar plant would be designed to meet the RCFD requirements. Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the RCFD and emergency responders. Access gates and internal access roads within the solar facility site would be identified. With implementation of BMPs, impacts to emergency access would be minimized; impacts would be less than significant.

TRA-6) Would Alternative 5 conflict with adopted policies, plans, or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

The TRA-6 analysis for Alternative 1 would apply to Alternative 5.

TRA-7) Would Alternative 5 alter waterborne, rail or air traffic?

The TRA-7 analysis for Alternative 1 would apply to Alternative 5.

TRA-8) Would Alternative 5 cause an effect, or a need for new or altered maintenance of roads?

Alternative 5 would improve Seeley Avenue, not Riverside Drive; however, these roads are currently maintained by the County of Riverside and would not cause an effect or need for new or altered maintenance of roads. Alternative 5 would require the construction of new access roads for the construction, operation, and maintenance of approximately three miles of the gen-tie line that would extend outside of the solar facility to the Colorado River Substation. The remaining portions of the gen-tie line would utilize the existing transmission line access roads and maintenance of roads would be similar to existing conditions. Impacts would be less than significant for maintenance of roads.

TRA-9) Would Alternative 5 cause an effect upon circulation during the project's construction?

Alternative 5 would impact circulation during construction; however, impacts would be less than significant.

TRA-10) Would Alternative 5 affect bike trails?

Alternative 5 not adversely affect bike trails; no impact.

Cumulative Impacts

Geographic Scope

Table 4.1-1 lists the cumulative projects within the vicinity of the Project area that were considered in this cumulative analysis. The geographic scope of the cumulative analysis for traffic and transportation includes the roadways and intersections in the vicinity of the Project area that may be directly or indirectly impacted by construction traffic generated by the proposed Project and Alternatives, which include I-10 and four study intersections. The City of Blythe did not identify any development projects that would add traffic to the intersections analyzed in the study. In coordination with a Riverside County Transportation Department representative, potential cumulative projects within the Project vicinity were identified. Approved traffic studies in the vicinity of the Project area were reviewed to eliminate projects that would not contribute traffic to the study area. The cumulative scenario accounts for construction of multiple large energy projects along the I-10 corridor and developments in the City of Blythe. The County of Riverside identified seven projects listed below that could conceivably be constructed during the year 2015. Table 4.2.14-4 lists cumulative projects that would have the potential to contribute to cumulative impacts.

Projects that would not contribute traffic trips to the four study intersections during the construction of the proposed Project and Alternatives were not analyzed. For example, the approved McCoy Solar Energy Project would utilize the Mesa Interchange; therefore, would not affect the four study intersections. The Blythe Solar Power Project has been suspended; as such, it is very unlikely that construction of this project and the proposed Project would occur simultaneously. It is anticipated that the Desert Quartzite project, which is similar in size and scope as the proposed Project, would require the preparation of an environmental document. To date, the Desert Quartzite project has not issued a Notice of Intent or Notice of Preparation. After issuance of a notice, the preparation of an environmental document may take approximately 12 to 18 months; therefore, peak construction of Desert Quartzite and the BMSP occurring simultaneously is very unlikely.

Should the peak construction schedules of the cumulative projects listed in Table 4.2.14-4 overlap, construction traffic from these projects would result in increased traffic within several miles or more along I-10 and regional roadways. As a conservative analysis, peak construction traffic from these cumulative projects was added to 2015 projected traffic (existing plus ambient growth). This resulted in a 2015-year Cumulative without Project scenario, to which the traffic of each action Alternative was added to the following study intersections:

- Intersection 1: Neighbours Boulevard and Riverside Drive
- Intersection 2: Neighbours Boulevard and I-10 Westbound Ramps
- Intersection 3: Neighbours Boulevard and I-10 Eastbound Ramps
- Intersection 4: Neighbours Boulevard and Seeley Avenue

Temporal Scope

The Project's and Alternatives' construction phases would produce the highest amount of traffic; the operational traffic would be similar to existing conditions. Therefore, the temporal scope of the cumulative impacts for the proposed Project and Alternatives would occur during the construction phase (between 2013 and 2016), with the highest-intensity period occurring in 2014 and 2015. As a conservative cumulative traffic analysis, the Year 2015 was determined to represent the highest traffic volumes for cumulative impacts as a result of the proposed Project and Alternatives.

Although it is very unlikely that the peak construction periods of multiple projects would coincide, as a conservative approach, the cumulative conditions represented below analyze the worst-case scenario. This addresses uncertainty about the timing of construction of other cumulative projects. It is very likely that the cumulative projects would track along different schedules from the proposed Project (and Alternatives) and peak construction would likely not occur at the same time.

Table 4.2.14-4 Cumulative Projects Included in Traffic Analysis

PROJECT NAME/APPLICANT	PROJECT DESCRIPTION	STATUS
Solar/Electric Generating Projects		
Blythe Airport Solar I Project • U.S. Solar EA # 42340	100 MW photovoltaic power plan on 640 acres in five- 20 MW phases that includes a 3,200 ft long 33 kV generation tie.	Approved November 2010
Blythe Energy Project II	520 MW combined-cycle power plant located entirely within the Blythe Energy Project area boundary. Blythe Energy Project II will interconnect with the Buck Substation constructed by the Western Area Power Administration as part of the Blythe Energy Project. Project is designed on 20 acres of a 76-acre site.	Approved 2005 Request for Construction commencement 2011-2016
Palo Verde Mesa Solar Project	437 MW PV solar plant that includes a 14-mile long transmission line to the Colorado River Substation.	Planned NOP issued August 2012
County of Riverside Projects		
PM33797	Schedule H: Divide 2.14 acres into 2 single family residential parcels	Planned
PM34400	Schedule H: Divide 80 acres into 2 single family residential	Planned
PM34759	Schedule H: Divide 34 acres into 3 parcels	Planned
PP23885	Church with accessory outdoor recreation/amphitheater 8,890 square feet Church	Planned

Source: KOA 2013.

Temporal Scope

The Project's and Alternatives' construction phases would produce the highest amount of traffic; the operational traffic would be similar to existing conditions. Therefore, the temporal scope of the cumulative impacts for the proposed Project and Alternatives would occur during the construction phase (between 2013 and 2016), with the highest-intensity period occurring in 2014 and 2015. As a conservative cumulative traffic analysis, the Year 2015 was determined to represent the highest traffic volumes for cumulative impacts as a result of the proposed Project and Alternatives.

Although it is very unlikely that the peak construction periods of multiple projects would coincide, as a conservative approach, the cumulative conditions represented below analyze the worst-case scenario. This addresses uncertainty about the timing of construction of other cumulative projects. It is very likely that the cumulative projects would track along different schedules from the proposed Project (and Alternatives) and peak construction would likely not occur at the same time.

Analysis of Direct and Indirect Impacts

Alternative 1: Proposed Project

Construction

This scenario accounts for construction of multiple large energy projects along the I-10 corridor and developments in the City of Blythe. Should the unlikely condition arise where peak construction of all the cumulative projects listed in Table 4.2.14-4 overlap, construction traffic from these projects would result in increased traffic within several miles or more along I-10 and regional roadways. It is very unlikely that the peak construction periods of multiple projects would coincide, as all projects are tracking on different schedules. For example, the Blythe Energy Project II was approved in 2005, the Blythe Airport Solar I Project was approved in 2010, and the Palo Verde Mesa Solar Project is in the initial stages of planning (Notice of Preparation issued in 2012). There may be some overlap in overall construction schedules (peak and non-peak) for a few cumulative projects and the LOS may decrease, but it would be temporary.

The worst-case scenario would involve peak construction of all the cumulative projects listed above. Table 4.2.14-5, *Cumulative Intersection Conditions*, lists the anticipated delays and LOS conditions that would result with peak construction of the cumulative projects (Cumulative 2015) with and without Project construction during the a.m. and p.m. peak hours. The Cumulative Scenario without Project would result in all study intersections operating at acceptable LOS levels with delays ranging from 9.5 to 16.6 seconds, except Intersection 3 (I-10 Eastbound Ramp and Neighbours Boulevard) during the p.m. peak hour would operate at LOS D and experience delays of 29.0 seconds. The Cumulative Scenario with Project would result in two intersections during the a.m. peak hour operating at unacceptable LOS levels (LOS D and E) and one intersection during the p.m. peak hour would operate at LOS F; delays would range from 10.0 to 126.5 seconds (2.1 minutes). Detailed impacts to each study intersection with the addition of the proposed Project are described below. Table 4.2.14-6, *Cumulative Contribution*, lists each project's contribution (trips and percentage) to the total cumulative trips at the study intersections during the a.m. and p.m. peak hours. Figures 4.2.14-1 and 4.2.14-2 illustrate the peak hour traffic movements for the Cumulative with and without Project Scenarios during the a.m. and p.m. peak hours.

- Intersection 1 (Neighbours Boulevard and Riverside Drive)
  - During the a.m. peak hour would degrade from LOS B to LOS E (unacceptable level) and delays would increase from 14.2 to 40.1 seconds. The major contributors to cumulative impacts at this intersection include the proposed Project (54%) and Palo Verde Mesa Solar Project (43%).
  - During the p.m. peak hour would degrade from LOS A to LOS B and delays would increase from 10 to 13.2 seconds.

- Intersection 2 (Neighbours Boulevard and I-10 Westbound Ramps)
  - During the a.m. peak hour would degrade from LOS C to LOS D (unacceptable level) and delays would increase from 16.6 to 26.2 seconds. The major contributors to cumulative impacts at this intersection include the proposed Project (40%) and Palo Verde Mesa Solar Project (49%).
  - During the p.m. peak hours would degrade from LOS B to LOS C and delays would increase from 13.1 to 20.0 seconds.

- Intersection 3 (Neighbours Boulevard and I-10 Eastbound Ramps)
  - During the a.m. peak hour would operate at LOS B and delays would increase from 11.2 to 14.6 seconds.
  - During the p.m. peak hour would degrade from LOS D (unacceptable level) to LOS F and delays would increase from 29.0 to 126.5 seconds (2.1 minutes).The major contributors to the cumulative impacts at this intersection include the proposed Project (49%) and Palo Verde Mesa Solar Project (38%).

- Intersection 4 (Neighbours Boulevard and Seeley Avenue)
  - During the a.m. peak hour would degrade from LOS A to LOS B and delays would increase from 9.5 to 10.6 seconds.
  - During the p.m. peak hour would degrade from LOS A to LOS B and delays would increase from 9.9 to 13.1 seconds.

Comparison of Existing (2011), Anticipated 2015, and Cumulative (2015) Scenarios

The impacts discussed above are related to the construction of numerous solar projects, which is considered temporary; the operational trips (12 full-time employees) related to the solar projects are significantly less than construction. Therefore, it is anticipated that the LOS for all four study intersection would be restored back to preconstruction conditions once construction of these respective projects is completed.

With the addition of more cumulative Project trips, the LOS degrades further and delays increase at each of the four study intersections. Under the existing conditions (2011) scenario, all intersections are operating an LOS A, with intersection delays ranging from 8.6 seconds to 9.8 seconds. With the addition of ambient growth, the anticipated 2015 conditions without Project scenario would still operate at an LOS A and experience intersection delays raging from 8.6 to 9.9 seconds. The 2015 with Project scenario, which would add approximately 429 trips, would result in all study intersections operating at an LOS B, with the exception of the Riverside Drive and Neighbours Boulevard intersection, which would operate at an LOS C during the a.m. peak hour. The intersection delays would range from 10.2 seconds to 16.4 seconds. During the Cumulative without Project scenario (addition of up to 531 cumulative trips) all study intersections would operate at acceptable LOS levels (LOS A through C), except Intersection 3 (Neighbours Boulevard and I-10 Eastbound Ramp) during the p.m. peak hour would operate at LOS D with a delay of 29.0 seconds. During the Cumulative with Project scenario (addition of up to 531 cumulative trips), all intersections would operate at acceptable LOS (LOS B to C), with the exception of Intersection 1 (Neighbours Boulevard and Riverside Drive) and Intersection 2 (Neighbours Boulevard and I-10 Westbound Ramp) during the a.m. peak hour and Intersection 3 (Neighbours Boulevard and I-10 Eastbound Ramp) during the p.m. peak hour.

Of the four study intersections, Intersection 4 (Neighbours Boulevard and Seeley Avenue) would receive the slightest increase in cumulative traffic (275 trips during the a.m. peak hour and 279 trips during the p.m. peak hour). This intersection would also experience the least amount of cumulative impacts and delays, because the proposed Project would contribute 92 percent of the cumulative trips.

Intersection 2 (Neighbours Boulevard and I-10 Westbound Ramp) would experience the greatest increase in cumulative trips (874 trips during the a.m. peak hour and 783 trips during the p.m. peak hour). During the a.m. peak hour, traffic flow would degrade from LOS C to LOS D; delays at this intersection would increase from 16.6 to 26.2 seconds. The proposed Project would be a considerable contributor to cumulative traffic, adding approximately 40 percent of the cumulative traffic. This intersection would operate at acceptable LOS during the p.m. peak hour (degrade from LOS B to LOS C).

Of the four study intersections, Intersection 1 (Neighbours Boulevard and Riverside Drive) during the a.m. peak hour would experience the greatest decrease in LOS—it would degrade from LOS B to LOS E with peak construction of the Project. North and south movements on Neighbours Boulevard are free-flowing. Eastbound and westbound movements on Riverside Avenue are stop-controlled. It would operate at an acceptable LOS during the p.m. peak hour, because as illustrated in Figure 4.2.14-2, most of the traffic (approximately 303 vehicles) from Riverside Drive is headed southbound (right turn) onto Neighbours Boulevard. These vehicles would need to stop, but would experience minimal interruption from five northbound vehicles and four southbound vehicles on Neighbours Boulevard, and eight vehicles from Riverside Drive would head southbound (left turn) onto Neighbours Boulevard. Therefore, traffic during the p.m. peak hour would experience approximately 13.2-second delays. During the a.m. peak hour, Intersection 1 would experience greater delays, because most of the traffic (approximately 307 vehicles) from Neighbours Boulevard would make a left turn onto Riverside Drive. Westbound and eastbound vehicles on Riverside Drive are stop-controlled and need to wait for large gaps to make a movement. This results in greater delays for the ten vehicles from Riverside Drive headed southbound (left turn) onto Neighbours Boulevard and five vehicles traveling eastbound on Riverside Drive. At stop-controlled intersections, left-turn movements are considered critical movements. Neighbours Boulevard, a free-flowing street, would have a very high volume and the critical movements (vehicles from Riverside Boulevard heading southbound) would experience longer delays to find a suitable gap in the traffic to make their turns. Therefore, these vehicles would experience delays approximately 40.1 seconds long,

resulting in an LOS E (unacceptable level). The proposed Project would contribute approximately 54 percent of the cumulative traffic; it would be a considerable contributor to cumulative traffic impacts.

The cumulative scenario for Intersection 3 (I-10 Eastbound Ramp and Neighbours Boulevard) during the p.m. peak hour would experience the greatest delays of the four intersections; it would operate at acceptable LOS B during the a.m. peak hour. The 2015 Cumulative without Project scenario would add 392 trips to Intersection 3 during the p.m. peak hour and would operate at LOS D with intersection delays of 29.0 seconds. The Cumulative with Project scenario would add another 376 trips (768 total cumulative trips) and degrade to LOS F with intersection delays of 126.5 second (2.1 minutes). As illustrated in Figure 4.2.14-2, most vehicles (429) would be traveling southbound from Neighbours Boulevard and then eastbound (left turn) onto the I-10 eastbound ramp. These vehicles would yield to vehicles traveling northbound (117) on Neighbours Boulevard. In addition, 57 vehicles traveling from the I-10 ramp headed north would need to make a critical movement (left turn). These vehicles would experience the greatest delays, because they would need to find a suitable gap in the traffic to make their turns. Therefore, these vehicles would experience delays approximately 126.5 (2.1 minutes) long, resulting in LOS F (unacceptable level). The proposed Project would contribute approximately 49 percent during the p.m. peak hour and would be a considerable contributor to cumulative traffic impacts.

The proposed Project is a considerable contributor to cumulative traffic impacts at three study intersections (Intersection 1 and 2 during the a.m. peak hour and Intersection 3 during the p.m. peak hour); Intersection 4 during the a.m. and p.m. peak hours would not result in cumulatively considerable traffic impacts. I-10 west and east of Neighbours Boulevard (State Route 78) would operate at LOS C. With the construction of the cumulative projects and BMSP, it is anticipated that the freeway would operate within Caltrans' acceptable LOS level.

With implementation of BMPs and mitigation measures, impacts to traffic and transportation would be minimized. Implementation of Mitigation Measure Traffic-1 (Traffic Management Plan) would reduce impacts from the proposed Project. Temporary construction traffic impacts that are cumulatively considerable may be reduced by coordinating construction schedules and staggering the cumulative trips to non-peak hours. With implementation of Mitigation Measures Traffic-1 and Traffic-3, cumulative traffic impacts to Intersections 1 through 3 may be improved to acceptable LOS levels. Table 4.2.14-8 lists the anticipated delays and LOS levels at each of the study intersections with the implementation of staggered construction of all cumulative trips (no staggered trips, 25 percent, 30 percent, and 40 percent). If no trips are staggered, Intersections 1 and 2 would operate at unacceptable LOS during the a.m. peak hour and Intersection 3 would operate at unacceptable LOS during the p.m. peak hour. If 25 percent of the cumulative trips were staggered to off-peak hours, all study intersections would operate at acceptable LOS, except Intersection 3 (Neighbours Boulevard and I-10 Eastbound Ramp), which would operate at LOS E, but experience a reduction in delays from 126.5 to 37.2 seconds. For Intersection 3 to operate at an acceptable LOS, approximately 40 percent of the cumulative trips would need to be staggered. Therefore, the Project's contribution towards temporary, significant cumulative impacts during Project construction would be reduced to less-than-significant levels.

The proposed Project would not substantially increase hazards due to design features or incompatible uses (impact TRA-4). The solar arrays would be fenced in; however, no major arterial roads would be closed and internal access roads within the solar facility site would all have sufficient emergency access. Impacts would not be cumulatively considerable and would be less than significant (impact TRA-5).

Construction traffic would increase delays at intersections, which would impact public transit routes mentioned above during a.m. and p.m. peak hours (impact TRA-6); however, with implementation of Mitigation Measure Traffic-1, the Project's contribution to cumulative impacts would be less than significant.

Operation and Maintenance

Project operation would result in a nominal increase in traffic and would generate substantially less traffic than construction activities. Also, the cumulative projects that would utilize the same intersections would

similarly have a limited workforce for operations. Therefore, no adverse impacts would occur due to traffic generated during the operation phase.

No road closures are anticipated for the Project; however, Seeley Avenue and Riverside Drive would be improved for emergency vehicle access. Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Therefore, impacts to emergency vehicles would not be cumulatively considerable significant impacts.

Decommissioning

Decommissioning impacts from the Project would be similar to construction. It is very unlikely that decommissioning of all cumulative projects would occur at the same time; however, it is assumed that decommissioning impacts from the cumulative projects would be similar to construction, but would be less intense and of a shorter duration. Therefore, the Project would not result in cumulatively considerable significant impacts.

Alternative 2: No Project Alternative

Under the No Project Alternative, gen-tie facilities would not be constructed on BLM-managed lands and solar facilities would not be constructed on private lands. The public lands in the Project area would continue to be managed by BLM in accordance with existing land use designations in the CDCA Plan, whereas the private lands would continue to be managed for agricultural production. Alternative 2 would not contribute to cumulative traffic and transportation impacts.

Alternative 3: Northern Alternative 230 kV Gen-tie Line Location

Alternative 3 is similar to Alternative 1 (proposed Project), with the exception of the location of the Northern 230 kV gen-tie line, which would be approximately 700 feet north of Alternative 1's proposed 230 kV gen-tie line. Construction of the solar facility would require the greatest workforce. Although Alternative 3's gen-tie line would be slightly longer than the proposed Project's (Alternative 1), it is anticipated that construction of both Alternatives would require the same workforce; however, Alternative 3 would require a slightly longer construction period. Therefore, the cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1.

Note: Bold font represents unacceptable LOS levels.

Construction

It is anticipated that Alternative 3 would experience similar traffic impacts (delays and LOS) as Alternative 1 (see Table 4.2.14-5). The cumulative scenario with Alternative 3 would result in two intersections during the a.m. peak hour operating at unacceptable LOS (LOS D and E) and one intersection during the p.m. peak hour would operate at an LOS F; delays would range from 10.0 to 126.5 seconds (2.1 minutes). Detailed discussions regarding cumulative impacts to each study intersection with the addition of Alternative 3 is described below.

- Intersection 1 (Neighbours Boulevard and Riverside Drive)
    - During the a.m. peak hour would experience the greatest decrease in LOS [degrade from LOS B to LOS E (unacceptable level)] and delays would increase from 14.2 to 40.1 seconds. The major contributors to cumulative impacts at this intersection include Alternative 3 (54%) and Palo Verde Mesa Solar Project (43%).
    - During the p.m. peak hour would degrade from and LOS A to LOS B and delays would increase from 10 to 13.2 seconds.
- Intersection 2 (Neighbours Boulevard and I-10 Westbound Ramps)
    - This intersection would experience the greatest increase in cumulative trips (874 trips during the a.m. peak hour and 783 trips during the p.m. peak hour). During the a.m. peak hour would degrade from LOS C to LOS D (unacceptable level) and delays would increase from 16.6 to 26.2 seconds. The major contributors to cumulative impacts at this intersection include Alternative 3 (40%) and Palo Verde Mesa Solar Project (49%). Alternative 3 would be a considerable contributor to cumulative traffic.
    - During the p.m. peak hours would degrade from an LOS B to LOS C and delays would increase from 13.1 to 20.0 seconds.
- Intersection 3 (Neighbours Boulevard and I-10 Eastbound Ramps)
    - Of the four study intersection, Intersection 3 would experience the greatest delays (2.1 minutes).
    - During the a.m. peak hour would operate at LOS B and delays would increase from 11.2 to 14.6 seconds.
    - During the p.m. peak hour would degrade from an LOS D (unacceptable level) to LOS F and delays would increase from 29.0 to 126.5 seconds (2.1 minutes).The major contributors to the cumulative impacts at this intersection include the Alternative 3 (49%) and Palo Verde Mesa Solar Project (38%).
- Intersection 4 (Neighbours Boulevard and Seeley Avenue)
    - This intersection would also experience the least amount of cumulative impacts and delays, because Alternative 3 would contribute 92 percent of the cumulative trips.
    - During the a.m. and p.m. peak hour would degrade from LOS A to LOS B and delays would range from 9.5 to 13.1 seconds.

As discussed in Alternative 1, it is very unlikely that the peak construction periods of all cumulative projects would occur simultaneously. There may be some overlap in overall construction schedules (peak and non-peak) for a few cumulative projects and the LOS for I-10 may decrease to LOS D, but it would be temporary and within Caltrans' acceptable LOS level. With implementation of BMPs, impacts to traffic and transportation would be minimized. Implementation of Mitigation Measure Traffic-1 (Traffic Management Plan) would reduce impacts from the proposed Project, and the implementation of Mitigation Measure Traffic-3 to coordinate the construction traffic schedules from multiple large-scale generation projects would further reduce the impacts to traffic and transportation. Therefore, Alternative 3's contribution towards temporary significant cumulative impacts during Project construction would be reduced at the three intersections to less than significant levels.

Alternative 3 would not substantially increase hazards due to design features or incompatible uses (impact TRA-4). The solar arrays would be fenced in; however, no major arterial roads would be closed and internal access roads within the solar facility site would all have sufficient emergency access. Impacts would not be cumulatively considerable and would be less than significant (impact TRA-5).

Construction traffic would increase delays at intersections, which would impact public transit routes mentioned above during a.m. and p.m. peak hours (impact TRA-6); however, the with implementation of Mitigation Measure Traffic-1, Alternative 3's contribution to cumulative impacts would be less than significant.

Operation and Maintenance

Operations under Alternative 3 would result in a nominal increase in traffic and would generate substantially less traffic than construction activities. Also, the cumulative projects that would utilize the same intersections would similarly have a limited workforce for operations. Therefore, no adverse impacts would occur due to traffic generated during the operation phase.

No road closures are anticipated for Alternative 3; however, Seeley Avenue and Riverside Drive would be improved for emergency vehicle access. Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Therefore, impacts to emergency vehicles would not be cumulatively considerable significant impacts.

Decommissioning

Decommissioning impacts from the Project would be similar to construction. It is very unlikely that decommissioning of all cumulative projects would occur at the same time; however, it is assumed that decommissioning impacts from the cumulative projects would be similar to construction, but would be less intense and of a shorter duration. Therefore, Alternative 3 would not result in cumulatively considerable significant impacts.

Alternative 4: Southern Alternative 230 kV Gen-tie Line Location

Alternative 4 is similar to Alternative 1 (proposed Project), with the exception of the location of the Southern 230 kV gen-tie line, which would be approximately 0.8 mile south of Alternative 1's proposed 230 kV gen-tie line. Although Alternative 4 would be slightly shorter than Alternative 1, it is anticipated that construction of both Alternatives would require the same workforce; however, Alternative 4 would require a slightly shorter construction period. Therefore, cumulative impacts associated with the construction, operation, maintenance, and decommissioning of the solar facility would be the same as Alternative 1.

Construction

It is anticipated that Alternative 4 would experience similar traffic impacts (delays and LOS) as Alternative 1 (see Table 4.2.14-5). The cumulative scenario with Alternative 4 would result in two intersections during the a.m. peak hour operating at unacceptable LOS (LOS D and E) conditions and one intersection during the p.m. peak hour would operate at an LOS F; delays would range from 10.0 to 126.5 seconds (2.1 minutes). Detailed discussions regarding cumulative impacts to each study intersection with the addition of Alternative 4 is described below.

- Intersection 1 (Neighbours Boulevard and Riverside Drive)
    - During the a.m. peak hour would experience the greatest decrease in LOS [degrade from LOS B to LOS E (unacceptable level)] and delays would increase from 14.2 to

40.1 seconds. The major contributors to cumulative impacts at this intersection include Alternative 4 (54%) and Palo Verde Mesa Solar Project (43%).
- During the p.m. peak hour would degrade from and LOS A to LOS B and delays would increase from 10 to 13.2 seconds.

- Intersection 2 (Neighbours Boulevard and I-10 Westbound Ramps)

  - This intersection would experience the greatest increase in cumulative trips (874 trips during the a.m. peak hour and 783 trips during the p.m. peak hour). During the a.m. peak hour would degrade from LOS C to LOS D (unacceptable level) and delays would increase from 16.6 to 26.2 seconds. The major contributors to cumulative impacts at this intersection include Alternative 4 (40%) and Palo Verde Mesa Solar Project (49%). Alternative 3 would be a considerable contributor to cumulative traffic.
  - During the p.m. peak hours would degrade from an LOS B to LOS C and delays would increase from 13.1 to 20.0 seconds.

- Intersection 3 (Neighbours Boulevard and I-10 Eastbound Ramps)

  - Of the four study intersection, Intersection 3 would experience the greatest delays (2.1 minutes).
  - During the a.m. peak hour would operate at LOS B and delays would increase from 11.2 to 14.6 seconds.
  - During the p.m. peak hour would degrade from an LOS D (unacceptable level) to LOS F and delays would increase from 29.0 to 126.5 seconds (2.1 minutes).The major contributors to the cumulative impacts at this intersection include the Alternative 4 (49%) and Palo Verde Mesa Solar Project (38%).

- Intersection 4 (Neighbours Boulevard and Seeley Avenue)

  - This intersection would also experience the least amount of cumulative impacts and delays, because Alternative 4 would contribute 92 percent of the cumulative trips.
  - During the a.m. and p.m. peak hour would degrade from LOS A to LOS B and delays would range from 9.5 to 13.1 seconds.

As discussed in Alternative 1, it is very unlikely that the peak construction periods of all cumulative projects would occur simultaneously. There may be some overlap in overall construction schedules (peak and non-peak) for a few cumulative projects and the LOS for I-10 may decrease to LOS D, but it would be temporary and within Caltrans' acceptable LOS level. With implementation of BMPs, impacts to traffic and transportation would be minimized. Implementation of Mitigation Measure Traffic-1 (Traffic Management Plan) would reduce impacts from the proposed Project, and the implementation of Mitigation Measure Traffic-3 to coordinate the construction traffic schedules from multiple large-scale generation projects would further reduce the impacts to traffic and transportation. Therefore, Alternative 4's contribution towards temporary significant cumulative impacts during Project construction would be reduced at the three intersections to less than significant levels.

Alternative 4 would not substantially increase hazards due to design features or incompatible uses (impact TRA-4). The solar arrays would be fenced in; however, no major arterial roads would be closed and internal access roads within the solar facility site would all have sufficient emergency access. Impacts would not be cumulatively considerable and would be less than significant (impact TRA-5).

Construction traffic would increase delays at intersections, which would impact public transit routes mentioned above during a.m. and p.m. peak hours (impact TRA-6); however, the with implementation of Mitigation Measure Traffic-1, Alternative 4's contribution to cumulative impacts would be less than significant.

Operation and Maintenance

Operations under Alternative 4 would result in a nominal increase in traffic and would generate substantially less traffic than construction activities. Also, the cumulative projects that would utilize the same intersections would similarly have a limited workforce for operations. Therefore, no adverse impacts would occur due to traffic generated during the operation phase.

No road closures are anticipated for Alternative 4; however, Seeley Avenue and Riverside Drive would be improved for emergency vehicle access. Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Therefore, impacts to emergency vehicles would not be cumulatively considerable significant impacts.

Decommissioning

Decommissioning impacts from Alternative 4 would be similar to construction. It is very unlikely that decommissioning of all cumulative projects would occur at the same time; however, it is assumed that decommissioning impacts from the cumulative projects would be similar to construction, but would be less intense and of a shorter duration. Therefore, Alternative 4 would not result in cumulatively considerable significant impacts.

Alternative 5: Reduced Acreage Alternative

Construction

It is very unlikely that the peak construction periods of multiple projects would coincide; however, there may be some overlap in overall construction schedules (peak and non-peak) for a few cumulative projects and the LOS for the I-10 freeway may decrease to LOS D, but it would be temporary.

It is anticipated that Alternative 5 would experience similar traffic impacts (delays and LOS) as Alternative 1 (Table 4.2.14-8). However, the solar facility components north of I-10 would not be constructed; therefore, Alternative 5 would not impact Intersection 1 (Riverside Drive and Neighbours Boulevard). Even with a reduction of trips north of I-10, during the a.m. and p.m. peak hours, the addition of Alternative 5's construction traffic would increase delays at Intersections 2, 3, and 4. Intersection 2 during the a.m. peak hour and Intersection 3 during the p.m. peak hour would operate at unacceptable LOS.

In comparison to Alternative 1, development of Alternative 5 would create additional traffic contributions to Intersections 2, 3, and 4. As previously described, the increased turn volumes for left turns could increase the delay at this location for Intersection 2 under Alternative 5. The westbound ramp would likely have a higher volume off the ramp in the a.m. at the stop, causing a higher delay as well as a higher queue build-up under Alternative 5. This would also occur for the eastbound ramp. Under Alternative 5, Neighbours Boulevard and Seeley Avenue would have an increased delay compared to Alternative 1 due to an increase in construction traffic volumes diverted south. With the addition of numerous cumulative projects, the impacts at each of these intersections would be increased even further in comparison to development of Alternative 1.

Similar to the Alternative 1 cumulative scenario, under the Alternative 5 scenario, Intersection 3 during a.m. and p.m. peak hours, and Intersections 2, 3, and 4 during the p.m. peak hours, would not comply with the Riverside County CMP, RCGP, or City of Blythe General Plan (impacts TRA-1 and TRA-2).

The forecast traffic volumes plus cumulative projects plus Alternative 5 construction traffic would cause a deterioration of LOS at Intersections 2, 3, and 4. Alternative 5 would be a cumulatively considerable contributor to traffic congestion impacts at Intersections 2 and 3; Intersection 4 would operate at an acceptable LOS. However, with implementation of BMPs, impacts would be minimized and implementation of Mitigation Measures Traffic-1 and Traffic-3 would reduce Alternative 5's considerable

contribution towards temporary significant cumulative impacts during construction at the three intersections to less than significant levels; Intersection 1 would not contribute to considerable cumulative impacts under Alternative 5.

As described above, it is very unlikely that the cumulative contribution of construction traffic volumes from the Rio Mesa Solar Electric Generation Facility, Blythe Solar Power Project, and Desert Quartzite would occur during overlapping peak construction periods, as these projects are tracking along different schedules. With implementation of BMPs and Mitigation Measures Traffic-1 through Traffic-3, Alternative's 5 cumulative contributions to traffic and transportation impacts would be reduced to less than significant levels.

Alternative 5 would not substantially increase hazards due to design features or incompatible uses (impact TRA-4). The solar arrays would be fenced in; however, no major arterial roads would be closed and internal access roads within the solar facility site would all have sufficient emergency access. Impacts would not be cumulatively considerable and would be less than significant (impact TRA-5). Construction traffic would increase delays at intersections, which would impact public transit routes mentioned above during a.m. and p.m. peak hours (impact TRA-6); however, with implementation of Mitigation Measure Traffic-1, Alternative 5's contribution to cumulative impacts would be less than significant.

Operation and Maintenance

Similar to Alternative 1, Alternative 5 operation would result in a nominal increase in traffic and would generate substantially less traffic than construction activities. Also, the cumulative projects that would utilize the same intersections would similarly have a limited workforce for operations. Therefore, no adverse impacts would occur due to traffic generated during the operation phase.

No road closures are anticipated for Alternative 5; however, Seeley Avenue would be improved for emergency vehicle access. Interior access roads within the solar facility site would be constructed to allow sufficient access for fire trucks and emergency responders (BMP-15). A Fire Management and Protection Plan (BMP-4) and Emergency Action Plan (BMP-5) would be prepared in cooperation with the Riverside County Fire Department and emergency responders. Access gates and internal access roads within the solar facility site would be identified. Therefore, impacts to emergency vehicles would not be cumulatively considerable significant impacts.

Decommissioning

Decommissioning impacts from Alternative 5 would have similar impacts as construction. It is very unlikely that decommissioning of all cumulative projects would occur at the same time; however, it is assumed that decommissioning impacts from the cumulative projects would be similar to construction, but would be less intense and of a shorter duration. Therefore, Alternative 5 would not result in cumulatively considerable significant impacts.

Mitigation Measures

The following measures are proposed to minimize impacts during Project construction:

Traffic-1 A construction phase Traffic Management Plan would be prepared in consultation with Caltrans and Riverside County for the roadway network potentially affected by construction activities at the Project area and off-site gen-tie line facilities. In order to achieve acceptable LOS, the Traffic Management Plan would include a plan to split the workforce and stagger arrival times during peak construction periods along with a traffic LOS and queue monitoring program, as determined necessary by the County's Transportation Department staff. The plan would be based upon the analysis set forth in the Draft EIR/EA. Carpooling shall also be required of contractor employees during the construction phase to help achieve acceptable LOS levels. In addition to the above-mentioned measures, other approaches could be considered to reduce peak hour traffic, such as requiring contractors to arrange employee busing and/or employee participation in park and ride.

Traffic-2 The contractor would conduct construction activities in accordance with Caltrans' applicable limitations on vehicle sizes and weights, Construction Excavation Permits obtained from Riverside County, Encroachment Permits from Caltrans, and permits and licenses from the California Highway Patrol and Caltrans for the transport of hazardous substances.

Traffic-3 Construction traffic coordination shall be required to address potential cumulative traffic issues associated with concurrent construction of several large projects with large workforces, approximately from 2013 through 2015. The Applicant shall coordinate construction traffic with applicable traffic management (e.g., Caltrans, Riverside County, and City of Blythe) as well as BLM representatives, as determined appropriate and necessary by the listed agencies. The Applicant shall also coordinate construction traffic with other proponents of renewable energy projects in the I-10 corridor. Cumulatively considerable projects shall be identified and the appropriate staggered arrival times or other approaches (such as busing, park and ride, or carpooling) will be prescribed to achieve an acceptable LOS.

Residual Impacts After Mitigation

With implementation of the BMPs, impacts from the proposed Project and Alternatives would be minimized. Implementation of Mitigation Measures Traffic-1 though Traffic-3 would reduce cumulative traffic impacts to a less than significant level.

NEPA Conclusions

The Project and each of the action Alternatives would involve the direct and indirect impacts and contribution toward cumulative impacts that are described above. The Project and action Alternatives would comply with all applicable laws and regulations, and traffic generated by the Project or any of the action Alternatives would not interfere with present or planned uses on federally managed lands. With the implementation of BMPs and the traffic Mitigation Measures identified above, the Project and action Alternatives would not have a significant adverse impact on traffic conditions. The No Project Alternative would not have impacts, as the existing circumstances and operations would continue essentially unchanged.

CHAPTER 5: OTHER NEPA/CEQA CONSIDERATIONS

5.1 Significant and Unavoidable Environmental Impacts

Analysis of environmental impacts of the proposed Blythe Mesa Solar Project (Project) and Alternatives are discussed in Chapter 4 (Sections 4.2.1 through 4.2.15) of this Draft Environmental Impact Report/Environmental Assessment (Draft EIR/EA). As required by the California Environmental Quality Act (CEQA), potentially feasible mitigation measures have been proposed to reduce significant environmental impacts to a level of less than significant. As required by the National Environmental Policy Act (NEPA), where potential adverse environmental impacts have been identified, mitigation measures are proposed that, when implemented, would reduce the impact. Summaries of the impacts and mitigation measures for each subject area are provided in the Executive Summary. No unavoidable significant environmental impacts were identified for the Project or an Alternative.

5.2 Irreversible and Irretrievable Commitments of Resources

CEQA Guidelines Section 15126.2 and NEPA Regulations (40 Code of Federal Regulations [CFR] Part 1502.16, 1508.8(b)), the Bureau of Land Management (BLM) NEPA Handbook (H-1790-1 Section 9.2.9) require a discussion of irreversible or irretrievable commitments of resources that would be caused by implementation of a proposed project or alternative.

Resources irreversibly or irretrievably committed to a proposed project are those used on a long-term or permanent basis. This includes the use of nonrenewable resources such as metal, wood, fuel, paper, aggregate, and other natural resources. These resources are considered irretrievable in that they would be used for a proposed action when they could have been conserved or used for other purposes. Another irreversible or irretrievable commitment of resources is the unavoidable destruction of natural resources that could limit the range of potential uses of that particular environment.

Construction of the proposed Project or Alternatives would commit nonrenewable resources during Project construction and ongoing utility services during Project operations. During Project operations, oil, gas, and other nonrenewable resources would be consumed for maintenance purposes, although on a limited basis.

At the end of the Project's useful life (approximately 25 years), the Project could be decommissioned. The Project is a renewable energy project intended to generate solar energy to reduce reliance on fossil fuels. Over the 25-year life of the Project, this renewable energy project would contribute incrementally to the reduction in demand for fossil fuel used to generate electricity, thereby resulting in a positive effect counteracting the commitment of nonrenewable resources to the Project.

5.3 Short-term Uses and Long-term Productivity

The NEPA Guidelines (40 CFR Part 1502.16) and the BLM NEPA Handbook (H-1790-1 Section. 9.2.9) require a discussion of the relationship between short-term uses and long-term productivity of the environment from implementation of a proposed project or one of the action alternatives. "Short term" refers to the total duration of project construction, whereas "long-term" (in the case of this Project) refers to the life term of the Project beyond the construction phase. The specific impacts of the proposed Project vary in kind, intensity, and duration according to the activities occurring at any given time. The proposed Project would involve tradeoffs between long-term productivity and short-term uses of the environment.

The short-term uses of the environment as a result of the Project and its built action alternatives would include those typically found with solar energy development. Short-term impacts associated with construction activities described in Chapter 4, Environmental Consequences, include effects to the natural environment and cultural resources. These can be compared to the long-term benefits of the

proposed Project and action Alternatives, all of which would provide for the production of clean, renewable energy consistent with federal and State goals to increase production of renewable energy to help reduce dependence on fossil fuels.

The action Alternatives would all also provide a long-term benefit by generating electric power without any increase in the use of non-renewable resources, such as fossil fuels, which would result in a benefit to air quality and a reduction in carbon-based emissions.

5.4 Growth-inducing Impacts

A project is considered growth-inducing if it can foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment (CEQA Guidelines Section 15126.2(d)). This definition includes projects that would remove obstacles to population growth, such as by extending public services into areas not previously served. Growth inducement can also be defined as an action that would encourage an increase in density of development in surrounding areas or encourage adjacent development. According to CEQA Guidelines Section 15126.2(d), growth should not be assumed to be beneficial, detrimental, or of little significance to the environment.

Construction of the solar facility and 230 kilovolt (kV) gen-tie line is anticipated to occur over a three-year period, of which peak construction would occur over two years and require approximately 500 daily workers present on the site. After completion of construction, operation of the solar facility would require 12 full-time personnel. As noted in the discussion of population and housing impacts in Chapter 4, this population increase during construction would be temporary and is not projected to create a need for additional housing. The proposed Project is located mostly within an unincorporated area of Riverside County, with a small part in the City of Blythe, and does not involve the development of a residential component that would result in direct population growth in the area. Additionally, the Project would not involve the development of any new roadways, water systems, or sewer systems other than those designed specifically to serve the Project. Infrastructure improvements to serve the Project would be limited and would not be available to serve surrounding areas. As such, the proposed Project would not induce substantial population growth in the area.

Additionally, the proposed Project would not induce population growth because:

1) the additional energy would be used to ease the burdens of meeting existing energy demands within and beyond the area of the Project;
2) the energy would be used to support already-projected growth;
3) the energy produced would be used to offset the use of fossil fuels to meet California's Renewable Portfolio Standard and Executive Order S-14-08; and
4) the factors affecting growth are so multifarious that any potential connection between additional energy production and growth would necessarily be too speculative and tenuous to merit extensive analysis.

Thus, this level of analysis is sufficient to inform the public and decision-makers of the growth-inducing impacts of the Project.

CHAPTER 6: COORDINATION AND CONSULTATION

6.1 Introduction

This chapter summarizes the Bureau of Land Management's (BLM) and the County of Riverside's public and agency involvement and outreach activities related to the Blythe Mesa Solar Project (Project). California Environmental Quality Act (CEQA) Guidelines Section 15129 states that an "EIR [Environmental Impact Report] shall identify all federal, state, or local agencies, other organizations, and private individuals consulted in preparing the draft EIR." The National Environmental Policy Act (NEPA) requires that federal agencies encourage and facilitate public involvement in the NEPA process to the fullest extent possible (40 Code of Federal Regulations [CFR] Part 1500.2(d), 40 CFR Part 1506.6). In the context of the preparation an Environmental Assessment (EA), however, "while some public involvement is required, [the BLM has] the discretion to determine how much, and what kind of involvement, works best for each individual EA" (BLM NEPA Handbook, Section 8.2).

Consistent with CEQA and NEPA requirements, public participation and agency consultation for this Project have been accomplished through issuance of public notices, public scoping meetings, and formal and informal consultation with agencies, stakeholders, landowners, and Native American Tribes. The consultation and coordination process helped to determine and focus the scope of the Draft EIR/EA and identify a range of alternatives and mitigation measures. The County of Riverside is the CEQA Lead Agency and the BLM is the NEPA Lead Agency.

Section 6.2 of this document describes the scoping process for the proposed Project that was conducted by the County of Riverside. Sections 6.3 through 6.8 describe the coordination and consultation process for preparation of a joint CEQA/NEPA document by the BLM and County of Riverside.

6.2 Draft EIR/EA Scoping Process

The public, affected agencies, Native American Tribes, and other interested parties were invited to participate in the environmental review process. The following sections summarize the scoping process; details regarding the process are documented in the Scoping Report found in Appendix A.

6.2.1 Notice of Preparation

In compliance with Title 14 of the California Code of Regulations (CCR) Section 15082, the County of Riverside prepared a Notice of Preparation (NOP) of an EIR that described the proposed Project and location, environmental review process, the potential environmental effects, and contact information, as well as announced the time and location of the public scoping meeting. On November 16, 2011, the NOP was filed with the State Clearinghouse (SCH) (SCH No. 2011111056). The NOP was also filed with the County of Riverside's County Clerk on November 21, 2011, which commenced the public review period. The NOP was sent via certified mail to 51 agencies (federal, State, County, and city), 22 Native American Tribes, and two elected officials. A copy of the NOP and mailing labels may be found in Appendix A.

6.2.2 Public Scoping Meeting

In compliance with CCR Section 15082(c), Riverside County conducted a public scoping meeting to inform the public about the Project; describe the purpose and need of the Project; provide information regarding the environmental review process; and gather public input regarding the scope and content of the EIR. The public scoping meeting was held on the following date and location:

December 12, 2011; 5:30 to 7:00 pm
Blythe City Council Chambers
235 N. Broadway
Blythe, CA 92225

The scoping meeting date and location were announced in the NOP. The meeting was also advertised in the Desert Sun and Palo Verde Times on December 2, 2011. Copies of the newspaper advertisements, PowerPoint presentation, display boards, comment form, and meeting transcript are located in Appendix A.

Project team members were available to answer questions about the displays and other Project-related topics and to listen to feedback, concerns, and issues raised by the public. A total of six people signed in at the scoping meeting (December 12, 2011). Attendees were encouraged to comment by filling out a comment form.

6.2.3 Outreach

Notification of Scoping Session

A notice of a Scoping Session was mailed to 120 property owners within 2,400 feet of the Project boundary (Appendix A). The notice briefly discussed the proposed Project, and date, time, and location of the scoping meeting.

Notification to Native American Tribes

In April 2011, a letter was submitted to the Native American Heritage Commission (NAHC) requesting information regarding Native American groups that may have historic ties to, and interest in, the proposed Project area. In May 2011, 20 CEQA scoping letters were sent to the tribes identified by the NAHC. Responses were received from the Aqua Caliente Band of Cahuilla Indians Tribal Historic Preservation Officer and the Augustine Band of Cahuilla Indians.

Native American tribal consultation by the BLM is summarized in Section 6.6.2.

6.2.4 Scoping Topics of Concern

A total of 10 comments were received during the scoping period for the proposed Project, which took place from November 21, 2011 to December 21, 2011. All 10 comments were received from agencies, and copies of the original comments letters may be found in Appendix A. The issue topics raised by the commenters included:

- Air Quality
- Public Services and Utilities
- Socioeconomics
- Hazardous Materials/Soils
- Cultural Resources
- Water Resources

6.3 Draft EIR/EA Informational Meetings

On May 10, 2012, two informational meetings were conducted for the Project. In the morning, the BLM sponsored the pre-application meeting with several resource agencies who have interest in the Project. The afternoon meeting was sponsored by the Project Applicant to provide Project information to Native American groups. The purpose of these meetings was to present information about Project alternatives; describe the purpose and need of the Project; provide information regarding the environmental review process; and gather input regarding the preliminary alternatives. The meeting between the Project Applicant and Native American tribes was not part of the BLM's Section 106 and government-to-government consultation efforts, which are discussed in Section 6.6.2.

The meetings consisted of a combination of open house and formal presentations. Display boards and a large Project map were set up around the room. Project team members were available to answer

questions about the displays and other Project-related topics. A question and answer session was held after the presentation. At the conclusion of the question and answer session, the open house continued and staff members were available to answer questions and gather input.

Tables 6-1 and 6-2 list the agencies and Native American tribes that were invited to the meetings.

Table 6-1 Agency Representatives

AGENCY	REPRESENTATIVE
California Department of Fish and Game	M. Rodriguez
City of Blythe	Barbara Burrow
National Parks	Andrea Compton
Riverside County	Ken Baez
Riverside County	Jay Olivas
Riverside County Airport Land Use Commission (ALUC)	John Guerin
Riverside County ALUC	G. Neal
Riverside County ALUC	Simon Housman
U.S. Army Corps of Engineers (USACE)	Shannon Pankratz
USACE	James Mace
USACE	Crystel Doyle
U.S. Fish and Wildlife Service (USFWS)	Nisa Marks

Table 6.2 Native American Tribes and Tribal Organizations I

AFFILIATION	REPRESENTATIVE
Agua Caliente Band of Cahuilla Indians	Patricia Tuck, THPO
AhaMaKav Cultural Society, Fort Mojave Indian Tribe	Linda Otero, Director
Ah-Mut-Pipa Foundation (Quechan Kumeyaay)	Preston J. Arrow-weed
Augustine Band of Cahuilla Mission Indians (Cahuilla)	Mary Ann Green, Chairperson
Augustine Band of Cahuilla Mission Indians (Cahuilla)	Karen Kupcha
Cahuilla Band of Indians	Luther Salgado, Sr. Chairperson
Chemehuevi	Joseph R. Benitez (Mike)
Chemehuevi Reservation	Charles Wood, Chairperson
Cocopah Museum/Cultural resources Dept. (Cocopah)	Jill McCormick, Tribal Archaeologist
Colorado River Indian Tribe (Mojave, Chemehuevi)	Ginger Scott, Museum Curator; George Ray, Coordinator
Fort Mojave Indian Tribe (Mojave)	Mr. Tim Williams, Chairperson
Fort Mojave Indian Tribe (Mojave)	Nora McDowell, Cultural Resources Coordinator
Fort Yuma Quechan Indian Nation (Quechan)	Michael Jackson, President
Morongo Band of Mission Indians (Cahuilla, Serrano)	Michael Contreras, Cultural Heritage Program
Quechan Indian Nation	Bridget Nash-Chrabascz, THPO
Ramona Band of Cahuilla Mission Indians (Cahuilla)	Joseph Hamilton, Chairman
San Manuel Band of Mission Indians (Serrano)	Ann Brierty, Policy/Cultural Resources Dept.
Santa Rosa Band of Mission Indians (Cahuilla)	Mayme Estrada, Chairwoman
Torres-Martinez Desert Cahuilla Indians (Cahuilla)	Diana L. Chihuahua, Vice Chairperson, Cultural
Twenty-nine Palms Band of Mission Indians (Chemehuevi)	Darrell Mike, Chairperson

6.4 BLM Public Scoping Meeting

On October 4, 2012, the BLM conducted a scoping meeting in Blythe, California. The BLM and Applicant presented information about the Project, alternatives, environmental review process, and potential impacts. A question and answer session was held after the presentation. At the conclusion of the question and answer session, the open house continued and staff members were available to answer questions and gather input. A total of ten individuals attended the meeting.

6.4.1 Notification

A Public Meeting announcement was mailed to 139 recipients, which included agencies, Native American Tribes, organizations, and interested individuals. A newspaper advertisement in the *Palo Verde Valley Times* was published on September 28, 2012 that announced the public meeting date, time, and location.

6.4.2 BLM Scoping Meeting Topics of Concern

In addition to the oral comments received at the BLM scoping meeting on October 4, 2012, a total of three comments were received. One comment was made by a concerned citizen on a public comment card. The other two were both from the same individual from a Native American organization. All three copies of the original comments may be found in Appendix A. The issue topics raised by the commenters included:

- Public Services and Utilities
- Socioeconomics
- Cultural Resources
- Hazards

6.5 Agency Contacts

In compliance with CEQA Guidelines Section 15129 and NEPA requirements, Table 6-3 below identifies federal, State, or local agencies and other organizations contacted in preparation of this Draft EIR/EA.

6.6 Consultations

6.6.1 Informal

Endangered Species Act Section 7

The U.S. Fish and Wildlife Service (USFWS) has jurisdiction to protect threatened and endangered species under the Endangered Species Act (ESA) (16 United States Code [U.S.C.] § 1531 et seq.). Formal consultation with the USFWS under Section 7 of the ESA is required for any federal action that may adversely affect a federally listed species. On November, 19, 2012, the USFWS issued a determination letter that the Project would not likely adversely affect federally listed species (see Appendix L); therefore, an ESA Section 7 formal consultation is not required.

The California Department of Fish and Wildlife (CDFW) is the administer agency for the California Endangered Species Act (CESA). CESA includes a requirement for consultation “to ensure that any action authorized by a state lead agency is not likely to jeopardize the continued existence of any endangered or threatened species… or result in the destruction or adverse modification of habitat essential to the continued existence of the species” (§ 2090). The CDFW has been contacted and informally consulted with regarding the proposed Project. These informal consultations included several in-person meetings and email concurrence on the biological surveys and data collection.

Table 6-3 Agency Contact Summary

AFFILIATION	DEPARTMENT	NAME	TITLE
Federal Agencies			
Bureau of Land Management		Frank McMenimen	Project Manager
Bureau of Land Management		Jeff Childers	Project Manager
Bureau of Land Management		Kim Marsden	Natural Resource Specialist
Bureau of Land Management		Tiffany Thomas	Archaeologist
U.S. Fish and Wildlife Service		Nisa Marks	Biologist
Federal Aviation Administration	Western Pacific Region		
Bureau of Indian Affairs	Southern California Agency		
U.S. Army Corp of Engineers	Regulatory Branch, Carlsbad Field Office	Shanti Abichandani Santulli	Project Manager
State Agencies			
California Department of Fish & Game	Inland Deserts	Rodriguez, Magdalena	Staff Environmental Scientist
California Department of Fish & Game	Inland Deserts	Shamar, Shankar	Staff Environmental Scientist of Renewable Energy
California Department of Fish & Game	Eastern Sierra Inland Deserts Region	MacNair, Leslie	Staff Environmental Scientist
Mojave Desert Air Quality Management District			
Native American Heritage Commission		Singleton, Dave	Program Analyst
Regional Water Quality Control Board #7	Colorado River Basin		
Southern California Association of Governments		Roth, Erik H.	Manager
County Agencies			
Riverside County	Planning Department	Ross, Larry	Principal Planner
Riverside County	Planning Department	Harrison, Tamara	Urban and Regional Planner IV
Riverside County	Airport Land Use Commission	Guerin, John	Principal Planner
Riverside County	Building & Safety Department	Gonzalez, Sam	Principal Inspector - Building & Safety
Riverside County	Environmental Programs Department	Young, Chad	Senior Ecological Resource Specialist
Riverside County	Planning Department	Jones, David	Chief Engineering Geologist
Riverside County	Planning Department	Jones, David	County Archaeologist
Riverside County	Flood Control District	Tina Hanson	Associate Civil Engineer
Riverside County	Regional Parks & Open Space District	Brewer, Marc	Senior Planner
Riverside County Planning Commission		Zuppardo, Jan	Planning Commissioner
City/Local Agencies			
Palo Verde Irrigation District		Henning, Roger	Chief Engineer
Palo Verde Resource Conservation District			

6.7 Consultations

6.7.1 Informal

Endangered Species Act Section 7

The U.S. Fish and Wildlife Service (USFWS) has jurisdiction to protect threatened and endangered species under the Endangered Species Act (ESA) (16 United States Code [U.S.C.] § 1531 et seq.). Formal consultation with the USFWS under Section 7 of the ESA is required for any federal action that may adversely affect a federally listed species. On November, 19, 2012, the USFWS issued a determination letter that the Project would not likely adversely affect federally listed species (see Appendix L); therefore, an ESA Section 7 formal consultation is not required.

The California Department of Fish and Wildlife (CDFW) is the administer agency for the California Endangered Species Act (CESA). CESA includes a requirement for consultation "to ensure that any action authorized by a state lead agency is not likely to jeopardize the continued existence of any endangered or threatened species… or result in the destruction or adverse modification of habitat essential to the continued existence of the species" (§ 2090). The CDFW has been contacted and informally consulted with regarding the proposed Project. These informal consultations included several in-person meetings and email concurrence on the biological surveys and data collection.

6.7.2 Formal

National Historic Preservation Act Section 106

Section 106 of the National Historic Preservation Act (NHPA), as amended, through its implementing regulations codified in "Protection of Historic Properties" (36 Code of Federal Regulations [CFR] Part 800), requires federal agencies to take into account the effects of a proposed undertaking on historic properties and to afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment. It has been determined that the proposed Project and Alternatives would constitutes an "undertaking" as defined in 36 CFR Part 800.16(y) and involves the type of activity that could affect historic properties (36 CFR Part 800.3(a)), the BLM as lead federal agency for the Project, has the statutory responsibility for compliance with provisions of Section 106 of the NHPR (36 CFR Part 800.2(a)(2)). 36 CFR Part 800.1(a) states that the purpose and goal of the Section 106 process as follows:

> The Section 106 process commences at the early stages of project planning and seeks to accommodate historic preservation concerns with the needs of federal undertakings through consultation among the agency official and other parties with an interest in the effects of the undertaking on historic properties. The goal of consultation is to identify historic properties potentially affected by the undertaking, assess the undertaking's effects, and seek ways to avoid, minimize, or mitigate any adverse effects on historic properties.

The steps in the Section 106 process are briefly described below. Following the description of the step is a summary presenting the BLM's compliance with the process to date, including government-to-government consultation with Native American Tribes.

Step 1: Initiation of the Section 106 Process. The agency official shall determine whether the proposed federal action is an undertaking per 36 CFR Part 800.16 and whether it has the potential to cause effects on historic properties. The agency official shall coordinate the steps of the Section 106 process with other concurrent reviews for the Project and plan for involving the public in the Section 106 process. The agency official shall also identify the appropriate State Historic Preservation Office (SHPO), Native American tribes, and other consulting parties to be included in the consultation process.

Step 2: Identification and Evaluation of Historic Properties (Cultural Resources). Properties within a project's Area of Potential Effects (APE) are identified with input from the SHPO, Native American tribes and other consulting parties, and evaluated for eligibility to the National Register of Historic Places (NRHP) in consultation with the SHPO. See 36 CFR Part 800.4. BLM applies NRHP criteria for eligibility for listing found at 36 CFR Part 60.4, in conformance with the Secretary of the Interior's Standards and Guidelines for Evaluation (48 Federal Register 44723-44726). In general, NRHP eligibility criteria include:

"The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

A) That are associated with events that have made a significant contribution to the broad patterns of our history; or
B) That are associated with the lives of persons significant in our past; or
C) That embody the distinctive characteristics or a type, period, method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D) That have yielded, or may likely yield, information important in prehistory or history."

Step 3: Assessment of Effects. BLM determines whether or not the undertaking will affect historic properties listed in or eligible for the NRHP (36 CFR Part 800.4(d)). BLM must seek concurrence from the SHPO, or Tribal Historic Preservation Officer (THPO) when appropriate, if it determines that no historic properties will be affected. When BLM determines that historic properties will be affected, BLM must assess whether such effects will be adverse by applying the criteria outline at 36 CFR Part 800.5(a)(1). "Effect" is defined in the regulations as an "alternative to the characteristics of a historic property qualifying it for inclusion in or eligibility for the National Register" (36 CFR Part 800.16(i)). An effect is deemed to be adverse when the effect may "alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling or association" (36 CFR Part 800.5(a)(1)).

Step 4: Resolution of Adverse Effects. Through consultation with the SHPO, Native American Tribes, other consulting parties, and the ACHP, if they elect to participate in Section 106 consultation, BLM will seek to resolve potential adverse effects of the proposed undertaking through a Memorandum of Agreement (MOA) or Programmatic Agreement (PA) (36 CFR Part 800.6). The purpose of consultation at this phase of the process is to develop treatment measures to avoid, resolve, or minimize potential adverse effects to historic properties, which will be implemented through the MOA or PA. An MOA often includes a treatment plan that takes into account the effects on NRHP-eligible or listed resources, depicts the APE, discusses reporting requirements, addresses discoveries and unanticipated effects, specifies curation requirements, and provides several administrative provisions. Consulting parties, including Programmatic Agreement tribes, and other parties as appropriate, are invited to participate in this consultation and the development of the MOA, and would typically be invited to sign the MOA as concurring parties. BLM must notify the ACHP of its adverse effect determination and intention to resolve such adverse effects through an MOA or PA. The ACHP may elect to participate in consultation for the MOA or PA. Because the BLM has found that there would be no historic properties adversely affected by the undertaking, neither an MOA or a PA is required for the Blythe Mesa Solar Project. As part of its responsibilities under Section 106 of the NHPA, the BLM sent a letter on August 7, 2013 to the California SHPO regarding the proposed Project. The purpose of the letter was to notify the SHPO of the Project and to initiate formal consultation on the Blythe Mesa Solar Project. The letter also requested that the SHPO combine consultation on the identification efforts with consultation on the determinations of eligibility and findings of effects. The letter then described Identification Efforts, Evaluation Efforts, Analysis of Effects, Agency Determinations of Eligibility, and Agency Finding of Effect. The BLM found that there would be no historic properties adversely affected by the undertaking.

On October 21, 2013, the BLM received a response from the SHPO requesting more information on the BLM's determinations and findings on the Blythe Army Air Base and the remnant historic features located

within the APE (i.e., hospital facility, barracks, fire station, and warehouses). The BLM sent this additional information to the SHPO in January 2014.

The BLM sent a letter on August 7, 2013 to the ACHP regarding the proposed Project. In this letter, the BLM invited the ACHP to participate in the Section 106 process in accordance with 36 CFR Part 800.2(b)(1). On August 14, 2013, the ACHP sent a letter to the BLM electing not to participate in the Section 106 process.

Native American Tribal Consultation

The BLM consults with Native American tribes on a government-to-government basis in accordance with several authorities, including NEPA, the NHPA, the American Indian Religious Freedom Act, and Executive Order 13175. Under Section 106 of the NHPA, the BLM consults with Indian tribes as part of its responsibilities to identify, evaluate, and resolve adverse effects on historic properties affected by BLM undertakings. To date, the BLM has identified and invited 15 Indian tribes to consult on the Project, including the Aqua Caliente Band of Cahuilla Indians, Augustine Band of Cahuilla Indians, Cabazon Band of Mission Indians, Cahuilla Band of Mission Indians, Chemehuevi Indian Tribe, Cocopah Indian Tribe, Colorado River Indian Tribes, Fort Mojave Indian Tribe, Fort Yuma Quechan Tribe, Morongo Band of Mission Indians, Ramona Band of Mission Indians, San Manuel Band of Mission Indians, Soboba Band of Luiseno Indians, Torres-Martinez Desert Cahuilla Indians, and Twenty-Nine Palms Band of Mission Indians.

The BLM holds Section 106 consulting party group meetings that offer a forum for providing project updates, presenting the results of cultural resources studies, and openly discussing and sharing ideas about information and concerns about projects. Also, individual government-to-government meetings with Indian tribes provide a separate forum for tribes to share information and concerns openly and candidly in an individual context, apart from other consulting parties and about other issues not necessarily related to the Section 106 process. To supplement these activities, additional good faith efforts are made by the BLM pursuant to Section 106, as part of the government-to-government consultation process. These additional efforts are summarized in Table 6-4.

Information and concerns brought to light during the consultation process are summarized below. All written communications submitted to the BLM by tribal officials are available in their entirety as part of the formal administrative record for the Project.

The BLM invited Native American tribes to consult on the Project on a government-to-government basis. Letters from the BLM dated March 12, 2012 were sent informing them about the application submitted by Renewable Resources Group for a ROW grant, explaining the BLM's role in the environmental review process, and inviting them to consult in a government-to-government manner pursuant to Executive Order 13175, the Executive Memorandum of April 29, 1994, and other relevant laws and regulations including Section 106. The letters also requested assistance in identifying any issues or concerns about the proposed Project, including the identification of sacred sites and places of cultural significance that might be affected by the Project.

In a response letter dated March 26, 2012, the Chairperson of the Augustine Band of Cahuilla Indians reported no specific resources in the Project area, requested that tribal monitors be used during the cultural resource survey, and asked to be notified if cultural resources were identified.

The BLM sent follow up letters to Native American tribes on August 8, 2013, reiterating its invitation for them to enter into government-to-government and Section 106 consultation. This letter also: (1) provided an update on the environmental review process and cultural resources identification efforts; (2) offered to provide copies of the *Blythe Mesa Solar Project: Archaeological Resources and Built Environment Survey, Riverside County, California* and *Blythe Mesa Solar Project: Archaeological Resources and Built Environment Survey, Transmission Line Alternatives Supplemental Report, Riverside County, California*; (3) summarized the BLM's determinations of eligibility for cultural resources within the APE; and 4) summarized the BLM's findings of effect for historic properties.

Responses were received from two Native American tribes, the Aqua Caliente Band of Cahuilla Indian and the Cocopah Indian Tribe, requesting copies of the survey reports. Copies of the two reports were sent to both tribes on September 24, 2013.

The BLM also made a Project update call on October 21, 2012 with the Historic Preservation Officer of the Fort Yuma Quechan Tribe. This call was part of on-going staff coordination between the BLM and Quechan regarding all Palm Springs Field Office projects.

As part of its consultation under Section 106, American Indian Religious Freedom Act, and Executive Order 13175 the BLM acknowledges the traditional importance and value of TCPs and the surrounding landscape as an integral part of tribes' history and continuing culture. To date, the BLM has not received information about TCPs or landscapes in the Project area from the tribes. Based on the limited response, the BLM assumes there are no TCPs within the Project area eligible under Criterion A of the NRHP for their traditional and cultural significance. However, the BLM continues to seek information from tribes about TCPs, should they exist in the Project area.

Additionally, to address the concerns related to the discovery of previously unidentified cultural resources during construction, the BLM will impose a robust construction monitoring plan that provides for tribal participation and the proper treatment and protection of prehistoric human remains should any be found during construction. The BLM will also require the development and implementation of a long-term cultural resource management plan.

Table 6-4 Tribal Consultation in 2012 and 2013

DATE	TYPE	CONTENT
March 12, 2012	Initial letter from BLM.	Sent to chairpersons and other officials at 15 tribes listed in Section 6.4.4.
March 26, 2012	Response Letter from Augustine Band of Cahuilla Indians.	The letter reported that there were no specific resources of concern in the area, requested the use of tribal monitors, and asked to be notified if cultural resources were identified.
August 8, 2013	BLM Findings/ Determinations Letter.	Letter provided a Project update and summarized BLM's determinations of eligibility and findings of effect.
September 18, 2013	Response Letter from Aqua Caliente Band of Cahuilla Indians. Email from Cocopah Indian Tribe.	Both responses requested copies of the archaeological resource and built environment survey reports.
September 24, 2013	Reports sent by BLM, as requested.	Copies of the archaeological resource and built environment survey reports sent to the Agua Caliente Band of Cahuilla Indians and the Cocopah Indian Tribe.
October 13, 2013	Telephone call with Fort Yuman Quechan Tribe.	Provided Project update as part of on-going staff coordination between the BLM and Quechan regarding all Palm Springs Field Office projects.

6.8 Review and Certification Process

6.8.1 CEQA Process

Public Notice/Public Review

In accordance with CEQA Guidelines, Section 15087, the Draft EIR public review and comment period should be no less than 30 days and no longer than 60 days. In the case of the proposed Project, the review period will be 45 day minimum per CEQA.

On June 17, 2014 a Notice of Completion (NOC) was filed with the State Clearinghouse for the Draft EIR/EA, concurrently kicking off the 45-day public review period of the Draft EIR/EA document and

associated technical appendices. The public review period on the Draft EIR/EA begins on June 17, 2014 and ends on August 1, 2014 after which time all comments received will be responded to.

Concurrent with filing the NOC, the County is also required to provide notice to the public, agencies, organization and other interested parties of the availability of the Draft EIR/EA for review and comment. A Notice of Availability was published in the *Desert Sun* and *Palo Verde Times* newspapers as well as posted at the County's website and libraries. Public comment on the Draft EIR/EA will be accepted in written form.

CEQA Lead Agency:

Riverside County Planning Department
4080 Lemon Street, 12th Floor
P.O. Box 1409
Riverside, CA 92502-1409

Response to Comments/Final EIR

A Final EIR will be prepared following the public review and comment period for the Draft EIR/EA.

The Final EIR will respond to written comments received during the public review and comment period and to oral comments made at any public hearings.

Certification of the EIR

The Final EIR will be independently reviewed and considered by the County. If the Final EIR is deemed "adequate and complete," the County may certify the EIR at a public hearing. In general, the rule of adequacy holds that the EIR can be certified if it demonstrates a good faith effort at full disclosure of environmental information and provides sufficient analysis to allow decisions to be made regarding the Project in terms of its environmental consequences.

Following review and consideration of the Final EIR, the County may take action to approve, conditionally approve, revise, or reject the Project. Written findings would accompany a decision to approve or conditionally approve the Project (CCR Section 15091). Likewise a statement of overriding considerations would be prepared if necessary (CCR Section 15093). A Mitigation Monitoring and Reporting Program (MMRP), as described below, would also be adopted for mitigation measures that have been incorporated into or imposed upon the Project to reduce or avoid significant effects on the environment.

Mitigation Monitoring

The County must adopt an MMRP for mitigation measures that have been incorporated into or imposed upon the Project to reduce or avoid significant effects on the environment (CCR Section 15097). This program will be designed to ensure that these measures are carried out during Project implementation.

The specific reporting or monitoring program required by CEQA is not required to be included in the EIR. However, any mitigation measures adopted by the County as part of the certified Final EIR will be considered as conditions for approval of the Project and will be included in the MMRP to ensure and verify compliance.

6.8.2 NEPA Process

The EA with associated technical appendices will be circulated for public comment and review for 45 calendar days, which is consistent with the CEQA review period. Upon the completion of the 45-day public comment and review period, a determination from BLM will be made regarding the selected alternative in the form of either a: 1) Notice of Intent for the preparation of an Environmental Impact Statement if there are significant, unavoidable effects to the human environment; or 2) an unsigned

Finding of No Significant Impact (FONSI) will be circulated for review with the Final EIR/EA explaining the reasons why the selected action will not have a significant effect on the human environment.

NEPA Lead Agency:

Bureau of Land Management
22835 Calle San Juan De Los Lagos
Moreno Valley, CA 92553

6.9 List of Preparers

A list of persons responsible for the preparation of various sections of the Draft EIR/EA or preparation of significant background materials, or who participated to a significant degree in preparing the Draft EIR/EA, is presented below.

County of Riverside—CEQA Lead Agency

- Adam Rush, Principal Planner
- Larry Ross, Principal Planner
- Tamara Harrison, Urban Regional Planner IV
- Chad Young, Biological Sciences
- David Jones, Geology
- Ruth Rhoades, Cultural Resources

Bureau of Land Management—NEPA Lead Agency

- Frank McMenimen, Project Manager
- Tiffany Thomas, Archaeologist
- Kim Marsden, Natural Resource Specialist

Consultants responsible for the technical analysis and document production are listed below, along with their qualifications.

NAME	QUALIFICATIONS	PARTICIPATION
POWER Engineers, Inc.		
Thom Ryan	B.S., City and Regional Planning; M.S., Environmental Studies; 35 years experience	Project Manager
Karen Cadavona	B.S., Biological Sciences; 10 years experience	Project Coordinator; Noise; Traffic and Transportation; Land Use and Planning; Population and Housing
Christopher Knopp	B.A., Environmental Science, International Relations, Political Science, 12 years experience	Deputy Project Manager, Quality Assurance/Quality Control
Kim Quinn	B.A., Environmental Studies, Emphasis Land Use Management and Planning; 13 years experience	Cultural Resources and Paleontological Resources; Geology and Soils
Gina Fegler	B.S., Landscape Architecture; 10 years experience	Aesthetics and Visual Resources
Mark Schaffer	B.S., Geography; M.S., Industrial Hygiene; 31 years experience	Agriculture; Environmental Justice; Hazards and Hazardous Materials; Land Use and Planning; Recreation; Socioeconomics;
Vanessa Santistevan	B.S., Biological Sciences, M.S., Wildlife Biology; 9 years experience	Biological Resources
Jim Rudolph	B.A., Anthropology; M.S., Anthropology; Ph.D. Anthropology; 41 years experience	Cultural Resources
Gini Austerman	B.A., Anthropology, Emphasis Archaeology; Minor Art Illustration, M.A. Anthropology, Emphasis Archaeology; 9 years experience	Cultural Resources

NAME	QUALIFICATIONS	PARTICIPATION
Allison Carver	B.S. Biology, B.A., Environmental Studies; 12 years experience	Hydrology and Water Quality
Sarice Friedman	B.S. Biological Sciences, M.S., Environmental Studies; 3 years experience	Document Preparation
Saadia Byram	Document Control, Administrative Record, Technical Writing, Project Control; 19 years experience	Technical Editing and Production
Aaron Wolf	B.S., Environmental Science and Policy; 3 years experience	Geographic Information System
David Barrackman	B.A., Geography; 11 year experience	Geographic Information System
Jason Pfaff	MS.S Architecture; 20 years experience	Visual Analysis, Glare Analysis, Visualization Technology
Brian Lathrop	B.S. Virtual Technology & Design; M.S. Architecture; 7 years experience	Visual Analysis, Glare Analysis, Visualization Technology
Charlie Koenig	B.S. Virtual Technology & Design; 7 years experience	Visualizations
Greg Wittman	B.A Geology; M.S. Hydrogeology; 38 years experience.	Water Supply Assessment
Subcontractors		
Scientific Resources Associated *Valorie Thompson*	B.S. Chemistry, M.S. Chemical Engineering, PhD. Chemical Engineering; 25 years experience	Air Quality/Greenhouse Gas Emission
Ninyo and Moore *Gregory T. Farrand*	B.S., Geological Sciences; M.S., City Planning; 33 years of experience	Geology and Minerals
John Minch and Associates, Inc. *John A. Minch*	M.S., Paleontology and Geology; Ph.D., Paleontology and Biostratigraphy; 40 years of experience	Paleontological Resources
KOA Corporation *Mujib Ahmed, P.E.*	M.S., Transportation Engineering 28 years of experience	Transportation
KOA Corporation *George Ghossain*	B.S., Civil Engineering; 12 years experience	Transportation

It takes quite a bit of work to combine the spreadsheets and then clean them up because the data entry is quite uneven. I'm presenting a summary at the AOU conference at the end of the summer, so the next time that I will probably do this will be in late July or August. I haven't been including Ocotillo Express in my summaries because this is a wind project. Also, the reported mortalities have been relatively low.

Here's the last summary that I did. Keep in mind that this is all incidental reporting. Is there something in particular that you are interested in?

Cheers, Tom

Hi Thom,

Was just speaking with Amedee, who suggested I contact you about a question dealing with SPUT mortality data. Do you have a relatively up-to-date SPUT workbook with data from all projects?

Our office has workbooks associated with a few individual projects, but am curious if a full, 'master' SPUT workbook exists. Even if you don't have a master, I am trying to track down injury/mortality information for (at least) Genesis, Sunlight, Ivanpah, and Ocotillo Express.

Thanks for any help you may have,

Chris

Hello everyone,

While completing weekly equipment net checks at the Desert Sunlight Solar Farm the wing of an unidentified bird was found in the netting at ground level (10m from arrays, 5m from road). No other piece of the carcass was found. The wing was collected and is stored in the biology freezer.

If you have any questions please contact me.

Hi Chris,

Here's the most recent spreadsheet for Ocotillo. I think Tera has sent you more recent SPUT reporting for the other projects than my summary spreadsheet.

Let me know if there is anything else you need.

Thanks, Tom

Hi Tera and Tom,

Per our telephone conversation, here is the information on the loon.

The loon was discovered on Monday April 28, 2014 at Unit 2 Solar field on the southeast side of the solar field. The exact location was WB 23. Please see the attached photo of the loon.

While performing his normal daily inspections, the field technician saw the loon and reported its location.

Our Production Leader bagged the loon and logged it on our Avian Log.

It is now in our freezer on site.

Hello everyone,

I am sending this update about a Western Grebe mortality that occurred on 6/23 but wasn't reported. I didn't know about the carcass until today when I went through our photos from the remote cameras at the on site kit fox den. Photos show the Western Grebe was carried from on site to the kit fox den. There were no remains of the bird carcass at the den site.

If you have any questions please contact me.

Thanks,

Hello everyone,

Today at Desert Sunlight Solar Farm the carcass of a male Redhead was found on the perimeter fenceline east of block 8, array 9. The carcass was fresh and had been decapitated. The carcass appeared to have been carried to the location, likely by a bird of prey, and dropped from the top of the fence. Kit foxes had tried digging under the fence to get at the carcass but were unsuccessful getting under the tortoise fence.

There was also an incident with a Roadrunner today that was found exhausted and running back and forth along the south perimeter fenceline, south of Block 10. A First Solar environmental worker was doing work in the area and the bird jumped under the wheel well of his cart. I caught the bird, offered it water, and released it outside of the south perimeter fence. The bird took a lot of water from a puddle on the ground, it crushed and ate pieces of ice, and rested in the cool water on the ground for about 20 minutes before running off and resting under a nearby creosote. The bird's energy appeared back to normal as it ran across the desert.

If you have any questions please contact me.

Thanks,

Brian Sandstrom

Hi Jody,

Here's my comments. There are several areas where I could have gone deeper, particularly in their justification of the % coverage and I only skimmed over their analytical methods. I hope this helps! If you have time, I'd also look at their responses to our comments, particularly where they seemed to drop comments because they were "beyond the scope" of the monitoring plan. Let me know if you have any questions.

Have a Happy 4th!

Tom

Desert Sunlight Fatality Monitoring Plan CLEAN 20140611.docx

Dammit! Sorry I didn't forward this to you sooner. I'm going through comments now and would appreciate your thoughts on their responses (in the track changes version). I know you're busy, but any time you can throw at this would be appreciated.
Sorry again...

All,

Please find a revised copy of the fatality monitoring plan for the Desert Sunlight Solar Farm attached, in both redline and clean versions. We have responded to USFWS comments from February either with edits or within the comments themselves (redline version). In addition, we have incorporated more recent guidance that has been transmitted by the Service.

We would like to emphasize that the goal of this document is to get an interim monitoring program in place, and so it is strictly a monitoring protocol. As such, it lacks some features that one might expect in a BBCS, most notably, an adaptive management section.

Thank you for your input and guidance on previous versions of the plan.

Regards,

Paul Rabie, PhD.

AVIAN INJURY AND MORTALITY REPORT FORM

Data Sheet Instructions and Information

***Please contact**

[INSERT APPROPRIATE R8 CONTACT INFORMATION] with any questions, problems, or suggestions for improvements to this form.

Instructions for Eagle Injuries/Mortalities

ABOUT THIS SPREADSHEET:

-Priority fields are indicated by an astericks and columns are shaded in grey. **At the very least, please try to populate all these fields, and any other applicable fields where possible, if that information is available.**

-**Drop down boxes are provided with several of the fields for your convenience, and to support greater consistency of data for these fields.**

-Please try to use one of the options provided within the drop down boxes for these fields. However, if you can not find the appropriate match in the drop down, you may enter your own text in the field as well.

-**If the option you select is "other" or contains the word "other" or you have additional details about your choice:** please try to provide additional details with your selection (again, all data entry cells in this spreadsheet will allow the entry of free text).

-**If you have been permitted to relocate a nest**, you may also report that relocation in this spreadsheet. This activity can be reported by use of the following fields: "Species Common Name", "Condition of Bird/Carcass (or if Active Nest Relocation, please indicate that here)", "Number of individuals found or number of nests relocated (if active nest relocation) " and "Disposition" (select the "Nest relocated" option).

IF YOU DISCOVER AN EAGLE:

If the eagle is dead, please complete the following steps:

1. Call your USFWS Office of Law Enforcement (OLE) point-of-contact Resident Agent in Charge (RAC) identified in your Special Purpsoe Utility (SPUT) permit conditions for instructions and approval before collecting or moving the carcass or its parts. You must contact OLE as soon as possible, but no later than 24 hours after discovery, to report the mortality.
2. Fill out as many of the fields in this sheet as possible regarding the incident, and send the report to your Regional USFWS Migratory Bird Permit Office as soon as possible.

If the eagle is alive, please complete the following steps:

1. Do not handle the eagle. Call your local migratory bird rehabilitation facility or a licensed veterinarian immediately for assistance.

2. Call your Regional USFWS OLE RAC identitied in your SPUT permit as soon as possible, but no later than 24 hours after discovery, to report the injury.

3. Fill out as many of the fields in this sheet as possible regarding the incident, and send the report to your Regional USFWS Migratory Bird Permit Office as soon as possible.

ject Feature information

Project feature where injured bird/carcass was found* (use if more than 2 features found)	Distance to Project Feature (Feet) *	Azimuth of carcass to project feature	Flight diverters on transmission line? (Y/N)	Type of flight diverter? (List various types)	Transmission compliant with APLIC 2012? (Y/N)	Type and configuration of structure (e.g. structure type, nameplate information, manufacturer information, model number, height, presence/absence of guy wires, structure ID#, line name, circuit number, circuit name, etc.)	Biometric Data on bird (Optional, but could include weight, wing chord, tarsus, tail molt, fat level, brood patch, etc.)	Additional Information and Notes (Band information, other identifying numbers, mitigating conditions)

Species	SPITS Code
Unknown	
Bald Eagle	BAEA
Golden Eagle	GOEA
Albert's Towhee	ABTO
Acadian Flycatcher	ACFL
Accipiters	AC$$
Acorn Woodpecker	ACWO
Adelaide's Warbler	ADWA
Akekee	AKEK
Akepa	LOXC
Akiapola'Au	HEWI
Akikiki	AKIK
Albatrosses	DI$$
Alder Flycatcher	ALFL
Aleutian Tern	ALTE
Allen's Hummingbird	ALHU
Alpine Swift	ALSW
Altamira Oriole	LIOR
American Avocet	AMAV
American Bittern	AMBI
American Black Duck	BLDU
American Coot	AMCO
American Crow	CROW
American Dipper	DIPP
American Golden-Plover	AGPL
American Goldfinch	AMGO
American Kestrel	AMKE
American Oystercatcher	AMOY
American Pipit	AMPI
American Redstart	AMRE
American Robin	AMRO
American Three-Toe Woodpecker	ATTW
American Tree Sparrow	TRSP
American White Pelican	WHPE
American Wigeon	AMWI
American Woodcock	AMWO
Ancient Murrelet	ANMU
Anhinga	AMAN
Anianiau	ANIA
Anna's Hummingbird	ANHU
Antillean Crested Hummingbird	CRHU
Antillean Euphonia	BHUE
Antillean Mango	ANMA
Antillean Nighthawk	CHGU
Antillean Palm-Swift	TAPH
Apapane	HISA
Aplomado Falcon	APFA
Arctic Loon	ARLO
Arctic Tern	ARTE
Arctic Warbler	AWAR
Arizona Woodpecker	ARWO
Ash-Throated Flycatcher	ATFL
Ashy Storm-Petrel	ASPE
Atlantic Puffin	COPU
Audubon's Oriole	BHOR
Audubon's Shearwater	AUSH
Auks, Murres, Puffins	AL$$
Aztec Thrush	RIPI
Azure Gallinule	AZGA
Bachman's Sparrow	BASP
Bachman's Warbler	BAWA
Baer's Pochard	BAPO
Bahama Mockingbird	BMOC
Bahama Swallow	BHSW
Bahama Woodstar	BAWS
Bahama Woodstar	PEVE
Baikal Teal	BATE
Baird's Sandpiper	BASA
Baird's Sparrow	BAJU
Baltimore Oriole	BAOR
Band-Rumped Storm-Petrel	HAST

Project Type
Geothermal
Other
Solar Power Tower
Solar PV
Solar Trough
Transmission Line
Transmission Sub-station or Switching Station
Wind

How found?
Carcass Survey
Incidental

Estimated time dead/injured before discovery
0-8 hours
8-24 hours
2 days
3-6 days
7 days
2 weeks
3 weeks
1 month +
Unknown

Project feature where carcass was found
Brine Pond
Communications Tower
Evaporation Pond
Fencing
Guy Wires
Heliostat
Other
Other Machinery
Pond Net
Project Building
PV Panel
Road
Solar Concentrating Tower
Solar Trough
Transmission Line
Transmission Tower
Vehicle
Water Supply Pond
Wind Turbine

Condition of Bird/Carcass
Active Nest Relocation
Alive, injured
Alive, sick
Articulated skeletal
Broken up
Dead, fresh (eyes moist)
Dead, semi-fresh (eyes desiccated, rigor mortis)
Feather spot
Mummified

Suspected cause of injury/mortality (field determination)
Barotrauma
Blinded/optical damage (radiant flux)
Collision (other)
Collision with solar panel/heliostat
Collision with wind turbine
Collision with wire
De-oiled
Disease
Drowned (evaporation pond)
Drowned (stock tank)
Drowned (other)
Electrocution
Entangled (net)
Other
Poisoned (lead)
Poisoned (other)
Poisoned (pesticide)
Predated
Predated while entangled
Scorched or singed
Unknown

Band-Tailed Pigeon	BTPI
Bank Swallow	BKSW
Barbary Falcon	FAPE
Barn Owl	BAOW
Barn Swallow	BASW
Barnacle Goose	BRGO
Barred Owl	BDOW
Barrow's Goldeneye	BAGO
Bar-Tailed Godwit	BTGO
Bay-Breasted Warbler	BBWA
Belcher's Gull	BEGU
Bell's Vireo	BEVI
Belted Kingfisher	BEKI
Bendire's Thrasher	BETH
Berylline Hummingbird	BCHU
Bewick's Wren	BEWR
Bicknell's Thrush	BITH
Black Bittern	IXFL
Black Catbird	BLCA
Black Guillemot	BLGU
Black Kite	BKKI
Black Noddy	ANMI
Black Oystercatcher	BLOY
Black Phoebe	BLPH
Black Rail	BLRA
Black Rosy-Finch	BRFI
Black Scoter	BLSC
Black Skimmer	BLSK
Black Storm-Petrel	BSPE
Black Swift	BLSW
Black Tern	BLTE
Black Turnstone	BLTU
Black Vulture	BLVU
Black-And-White Warbler	BAWW
Black-Backed Woodpecker	BTWO
Black-Bellied Plover	BBPL
Black-Bellied Storm-Petrel	BBPE
Black-Billed Cuckoo	BBCU
Black-Billed Magpie	BBMP
Blackbirds	IC$$
Black-Browed Albatross	BBAB
Blackburnian Warbler	BLWA
Black-Capped Chickadee	BCCH
Black-Capped Gnatcatcher	BCGN
Black-Capped Petrel	BCPE
Black-Capped Vireo	BCVI
Black-Chinned Hummingbird	BCHM
Black-Chinned Sparrow	BCSP

Hi Tom,
Hope you're having fun! I've attached my review of your review. There are some outstanding questions from our original review that I left in there; some of which I conveyed to you yesterday in the email below. One other thing, I'm curious if we should offer a method that will get to our question of day vs. night impacts per your comment below? Let me know what you think and I'll forward to Amedee?
Thanks,
Jody
Carcasses from species that are nonresident and are night-migrants will be considered night-time fatalities; and those that are nonresident and day-migrants will be considered day-time fatalities[FWS MB-TD1] .

[FWS MB-TD1]This approach is not adequate to determine when mortalities are actually occurring as is requested per the monitoring objectives.

> Thanks for the heads up, Tom. Here are my questions of the day -- you know, to contemplate in your spare time at NCTC (i.e., while you're not in the bar -- well, or even if you are in the bar):
>
> 1) Does the line-distance sampling method make sense here?
>
> 2) Does the response to this comment make sense?
>
> Our original comment: The field study cited here, which is used to justify 35m and 70m search widths, is problematic. According to Table 1 (page 7) of that reference:
>
> Pheasant: no birds left at 61-70m, unequal # of birds 51-60m (3-5x amount of other distances)
>
> Pigeon: no birds left at 41-70m, unequal # of birds 21-30m (2-4x amount of other distances)
>
> Quail: no birds left at 41-60m, unequal # of birds 61-70m (2-3x amount of other distances)
>
> Starling: no birds left at 31-40m, unequal # of birds 61-70m (1/3-1/2x amount of other

distances)

Sparrow: no birds left at 31-40 & 51-70m, unequal # of birds 21-30m (2-5x amount of other distances)

We should discuss and examine this reference carefully. All birds/carcasses were seen less frequently as a function of distance away from the observer (sparrows were only seen 40% of time within 10m). The transect widths need to be reduced greatly and all birds/sizes need to be searched for equally. The proposed DS protocol includes a 20% area search for large birds, 10% area for bats and small birds.

PAR response: We disagree that the field study data indicate problems. The table shows sample sizes ranging from 23 to 35 in five categories of birds and overall detection probabilities greater than 30% in all cases. The greater concentration of birds at greater distances is appropriate because it concentrates effort in the more-difficult-to-estimate areas. Also, because the intent is to fit a distance-detection function, it is not meaningful to consider N within each distance band; the continuous function is fit to overall N for the class of birds (eg pheasant) for which detection is being measured. Further, Carcasses are expected to be seen less frequently as a function of distance and the trial is intended to provide data that allows us to quantify the detection function.

I just realized it's 8 back there, so I'll send this now. I'm sure I'll have more.

Have fun!!

Hello everyone,

This morning at Desert Sunlight Solar Farm the carcass of a Lesser Nighthawk was found in an open staging area between block 1 and the substation on site. The bird was hit in the morning on the highway and fell from the truck in the staging area. It was collected and stored in the biology freezer

If you have any questions please contact me.

Hi everyone,
First of all, we want to thank all of you for putting in the time and energy to attend conference calls; pull together costs and descriptions of marsh creation, enhancement, and restoration work; and to talk in general about potential impacts to Yuma clapper rail from utility-scale solar projects and how to offset those impacts on your lands. Unfortunately, despite all of our efforts, our leadership in Region 8 disagrees with our assessment that take of YCR from solar projects is reasonably certain to occur (even though we have two dead bodies in 2 years) and does not support our proposal to offset the impacts of the taking off-site. So, the focus will be on-site minimization measures and monitoring to determine if take does occur, without the benefit of formal consultation or a consensus on what might constitute adequate mortality monitoring to learn more about the issue.

We (field office staff working on this) view this as a failure on the part of our agency to conserve trust resources and are concerned that this is precedent setting for all other solar projects within the range of the species. BUT, if the BLM and our leadership agree that take may occur across all projects, but cannot be attributed to any single project, we may still have an opportunity to flesh out and implement our programmatic strategy. I don't follow this logic, but am willing to run with it in hopes that we can get some off-site habitat compensation in place at some point down the road. So, I intend to clean up the draft conservation measure with all the numbers and options so we're ready to go -- if and when another rail dies or we decide to move forward with the programmatic. We'll be sure to pass it by you when the time comes.

In the meantime, we will also continue to seek partnerships and funding to learn more about YCR demographics, dispersal behaviors, and population viability. The more data we have, the better equipped we are to make an argument one way or the other in the best interest of the species.

Again, thank you. If you have any questions or anymore information to add, please just let us know.
Jody

Very sad, very sad indeed. If bodies won't convince them, clearly there is nothing that will. I took the liberty of tracing routes that would be more likely to be used by Yuma Ridgway's rails, given their use of the Colorado River and Salton Sea basin. IMHO, projects along these areas may have the same effect as the two that already resulted in take. The path through the Imperial Valley is just one of many possibilities, whereas those through the desert seem like limited options.

Jody, that is very disappointing, and must be especially frustrating to you after all of the work you (and others) have put in. I'm sorry to hear that, but I think you're moving forward in the right (only) direction you can so we'll have good data in the future and, hopefully, get some funding to research the information we don't have.

Take care,
Brenda

Thanks, Karen. We're certainly still working on solar projects, particularly in Imperial, so there will be other project-specific opportunities -- we may just have to approach it from a general marsh bird perspective.

We look forward to working more closely with you guys as well.
Take care,
Jody

How is this going to affect DRECP? BLM already objected to our inclusion of basic biological information on YCR population decline and dispersal in the desert. Dudek has calculated operational impacts to YCR (for all RE technologies combined), something like 60 birds plan-wide through 2040. I don't think BLM has noticed that yet....

ISECS - WEGR Mortality 06-20-13 .pdf

Hi Amedee,

Here are a few bird mortality photos I have in my archive. I also have picture of various passerines, though nothing as connected to the solar as these. There are a number underneath powerlines, if that might be helpful. I think this is a different Clapper Rail than the one you have. I also added a loon picture just because they are such stunning birds, even in death, and there are two pictures of Western Grebes with associated smears on the panels. The second with the bird still lying on the panel is within the ISECS mortality report and would need to be extracted. I couldn't find any pictures of the Peregrine. You might check with CEC. Let me know if you come up with anything.

Thanks, Tom

Hi Amedee,
Just trying to figure out where we are on this. After we sent these comments up to you, I think you'd mentioned holding off on responding until after a meeting with industry. But I think that happened some time ago and I think we should get this moving again. I suspect they're almost operational out there.
Thanks,
Jody

Hi Amedee,
Tom and I sifted through what WEST sent and attached are our comments. Bottom line -- they're still proposing 20% every 14 or 25 days depending on the season. We still find this unacceptable as it does not yet incorporate the carcass persistence trials that are ongoing at the site.

Please give it a look -- we left some of the comments in that they either didn't address; addressed and we don't agree; or remain outstanding pending additional discussions. Once you've had a chance to review, I'd like to be the one to send it back to WEST so we can try to maintain some semblance of field level lead. Does that seem fair? Even though we all know Amanda will be calling you :)

Sorry it took awhile to get to this, but other issues have been bearing down on us.
Talk soon,
Jody

Hey Jody-
Hope all is well... Who in BLM is working on this with you? Kim Marsden? Larry LaPre? Mark Massar? Or could it be no one?

I am very concerned that Sunlight is not giving a good faith effort in their monitoring plan, and I really want to make sure that BLM is doing are part to ensure we get good data by which to make more informed decisions and the ability to actually implement adaptive management. It seems to me that route this plan is going is to mot have enough data as to make it inconclusive enough to make any recommended changes. Such kind of subversion cannot be tolerated.

Let me know if I need to engage, will you?

thanks!
A

All,
Our sincere apologies for the delay in responding to your submittal of the revised mortality monitoring plan for the Desert Sunlight project. As you know, we have been working internally and with the solar industry to clarify monitoring objectives and methods. The team drafting the comprehensive mortality monitoring protocol has begun work on the product, but it is not expected to be available for a few more months. That being said, we would like to work with you go begin monitoring at the Desert Sunlight site as soon as possible given the project is largely operational, correct? The crux of the most recent plan submitted appears to be the percent of the site covered, the frequency based on carcass persistence, and the day vs. night timing of mortalities. Please give our comments a look and let's have a call at your earliest convenience.
Thanks,
Jody

Hello,

An adult male brown-headed cowbird carcass was found within bird netting of stored unused posts near block 1 array 8 just north of the substation. The nearest project component is the fenced storage area with additional unused equipment. The solar arrays are approximately 70m from the location of the carcass. Photos are attached.

If you have further inquiries about this mortality, please feel free to contact me. (949)423-8770

Thanks,
Lehong

Good morning everyone,

For the 2014 avian surveys, Ironwood is recommending modifying the avian transects from the straight lines to more of a triangle method to ensure the surveyors could observe more area. We kept the original locations of the transects on site to ensure that we could compare results with older data. Thus this change did not affect the effort or costs but does give more thorough coverage of the site.

I have attached a memo sent to me, per my request, explaining the new transect information with a map depicting this change. If you believe this method should not be pursued please let us know soon so that we can return to the original methodology.

The avian surveys have been occurring every month as outlined within the avian work plan and we are gearing up to ensure that another round of golden eagle surveys will be started this winter season.

Kim, I was not sure how you wanted this “new” transect information filed for BLM purposes. Should we attach an update to the exiting work plan or write the memo as an amendment and attach to original? Please instruct me as to how you would like to see the information if acceptable.

If you have misplaced the original work plans (dated 042814) please inform me and I will send you a link to the information.

Let me know if anything else is needed.

Have a positively great fall day!

Hi Jeep,

I gave their modification request another read, This time I read the text rather than just looking at the pictures! I think they do a good job addressing the questions that we discussed and actually increase the total area covered. The end points for each leg of the triangle are separated by 250 m. There is still some potential for overlap for birds >100m, which I can ask how they will address.

Let me know if you have any thoughts. Otherwise, I'll reply with an affirmative response with a question or two. I'll also ask for a summary of previous surveys.

Thanks, Tom

Date: Tuesday, September 30, 2014 2:59:31 PM
Attachments: Dietsch_Solar Avian Interactions_AOU_2014_09_24.pdf
Avian_Bat_Mortality_20140901.pdf

Hi Amy,

I've attached the Desert Sunlight SPUT report and the presentation that I gave at the American Ornithological Union meeting last week. Keep in mind that most of the data in the presentation and all of the data in the SPUT report are incidental reports. One of the slides gives a summary of the caveats that I associate with this data. The data for PV projects comes from 3 different projects. Though the majority of the data come from Desert Sunlight, the waterbird mortalities are consistent across the other projects. Please let me know if you have any questions about either the report or the presentation.

I had a call with Jody Fraser and Pete Sorenson this morning and we discussed the Desert Sunlight BBCS. As you probably know, we provided comments back to the project proponent on the latest version of the BBCS last month, but haven't heard anything from them since. Everyone is available if you would like to schedule a meeting to discuss our comments and recommendations for the BBCS.

Please let us know if there is anything that we can do to help.

Thanks, Tom

All,
Our sincere apologies for the delay in responding to your submittal of the revised mortality monitoring plan for the Desert Sunlight project. As you know, we have been working internally and with the solar industry to clarify monitoring objectives and methods. The team drafting the comprehensive mortality monitoring protocol has begun work on the product, but it is not expected to be available for a few more months. That being said, we would like to work with you go begin monitoring at the Desert Sunlight site as soon as possible given the project is largely operational, correct? The crux of the most recent plan submitted appears to be the percent of the site covered, the frequency based on carcass persistence, and the day vs. night timing of mortalities. Please give our comments a look and let's have a call at your earliest convenience.
Thanks,
Jody

Hello everyone,

The carcasses of an American Coot, Ruddy Duck and an Audobon's Warbler were found today along the Desert Sunlight Gen-tie that runs parallel to Kaiser Road. The quarterly gen-tie invasive weed survey was being conducted and the carcasses were found incidentally in the survey area. All carcasses were fresh and intact. They were all collected and stored in the bio freezer.

The wings of a Wilson's Snipe were found on the Desert Sunlight Solar Farm site. Both wings were hanging from the site's perimeter fence north of block 14, array 18. White wash was observed below the wings. The wings were collected and stored in the bio freezer.

If you have any questions please contact me.

Thanks,

Brian Sandstrom

Hello everyone,

The carcass of an Eared Grebe was found between the security fences at the south pond. The carcass was collected and stored in the bio freezer. Also found at the south pond was an American Coot that was alive but exhausted on the outside of the pond security fence. The AMCO didn't have any obvious trauma and when it was placed in a bucket with water it floated normally and drank water. It was taken to Lake Tamarisk to be released but when set in the water it was obvious it had internal issues. The bird was disoriented and swam against the shore. Its strength slowly left and twenty minutes after being released it had died. The carcass was collected and stored in the bio freezer.

If you have any questions please contact me.

Thanks,

Brian Sandstrom

Subject: Quartzite 2014 Avian Work Plan Line Transect Modification Request
To: "Marsden, Kim" <kmarsden@blm.gov>, Roy Skinner <Roy.Skinner@firstsolar.com>, "Rodriguez, Magdalena@Wildlife" <Magdalena.Rodriguez@wildlife.ca.gov>, "Fraser, Jody" <jody_fraser@fws.gov>

Good morning everyone,

For the 2014 avian surveys, Ironwood is recommending modifying the avian transects from the straight lines to more of a triangle method to ensure the surveyors could observe more area. We kept the original locations of the transects on site to ensure that we could compare results with older data. Thus this change did not affect the effort or costs but does give more thorough coverage of the site.

I have attached a memo sent to me, per my request, explaining the new transect information with a map depicting this change. If you believe this method should not be pursued please let us know soon so that we can return to the original methodology.

The avian surveys have been occurring every month as outlined within the avian work plan and we are gearing up to ensure that another round of golden eagle surveys will be started this winter season.

Kim, I was not sure how you wanted this “new” transect information filed for BLM purposes. Should we attach an update to the exiting work plan or write the memo as an amendment and attach to original? Please instruct me as to how you would like to see the information if acceptable.

If you have misplaced the original work plans (dated 042814) please inform me and I will send you a link to the information.

Let me know if anything else is needed.

Have a positively great fall day!

Tonya Moore

Hi Tom,

It was good to talk. Below are some useful links. The first is the webinar Kristen gave for the FWS. Attached is the list of target taxa we have identified so far and a couple of papers of interest including the recent WIWA paper. Additional papers can be found on the CTR web site: http://www.environment.ucla.edu/ctr/research/neotropical-migrants.html.

1. Link to the webinar (with Kristen presenting the research): http://training.fws.gov/topic/online-training/webinars/osa.html.

2. Link to download recent Powerpoint presentation: http://nctc.adobeconnect.com/Ruegg

3. Link to Science Magazine article covering the WIWA paper: http://news.sciencemag.org/biology/2014/08/hidden-bird-migrations-revealed-dna

I look forward to getting a list of target water birds from you! I'm excited to be moving forward!

All the best,

Tom

To: Amy Fesnock, BLM

Regarding: BBCS/Bird and Bat Fatality Monitoring Plan for the Desert Sunlight Solar Farm, Riverside County,California

In follow-up to our meeting on October 15th and related correspondence with both BLM and USFWS, attached is the revised Bird and Bat Conservation Strategy for the Desert Sunlight Project. Because the Project is finishing up construction and will commence commercial operations in a couple of months, we have updated the BBCS accordingly to focus on post-construction avian and bat fatality monitoring.

As we discussed at our last meeting, and in further discussions internally, we have incorporated the following parameters for the monitoring plan:

Parameter	Current Plan
Solar Field- % coverage for monitoring	25%
Solar Field- frequency of searches	Every 7 days during migration and every 21 days during non-migration
Fenceline- % coverage for monitoring	100% (same frequency as solar field)
GenTie- % coverage for monitoring	50% (same frequency as solar field)
Duration of monitoring	minimum of 2 years
Bias trials – array, fenceline and gentie	Yes searcher efficiency and Yes carcass removal trials

Please let the Desert Sunlight team know any comments or questions that you have so that we may get the plan finalized as soon as possible. As always, we appreciate your assistance in continuing to move this process forward.

Regards

Wallace Erickson (on behalf of the Desert Sunlight Project)

13 November 2014

From: The Genesis Solar Project

To: Eric Veerkamp (CEC) and Amy Fesnock (BLM)

Cc: Amedee Brickey (USFWS), Jody Fraser (USFWS), Tera Baird (USFWS), Thomas Dietsch (USFWS), Pete Sorenson (USFWS), Eric Davis (USFWS), Magdalena Rodriguez (CDFW), Eric Knight (CEC), Carol Watson (CEC), Anwar Ali (CEC), Kim Mardsen (BLM), John Kalish (BLM), Thomas Thomas Pogacnik (BLM), Luke Goguts (NEER), Winifred Perkins (NEER), Kenny Stein (NEER), Ashley Pinnock (NEER), Jennifer Field (NEER), Lauren Romero (NEER), Idayna Stokes (NEER),Tracey Johnson (WEST), Paul Rabie (WEST)

In follow-up to our meeting on October 24th and related correspondence, attached is the revised Bird and Bat Conservation Strategy for the Genesis Project that is consistent with the recently submitted revised BBCS for Desert Sunlight. Because the Project is operational, we have updated the BBCS accordingly to focus on post-construction avian and bat fatality monitoring. We have included a comment and response document in a separate file that identifies the original REAT agency comments and includes responses to those comments. Given the large number of comments, and the change in format for the new BBCS, we provided reference to the sections in the March 2014 version of the BBCS as well as a reference in our response to the new section in this version of the BBCS where the comment was addressed. The comments related to pre-construction or construction activities were moved to the end of the Response document and most of these were not specifically addressed unless they indirectly or directly were related to the post-construction activities. There may be a few of these that still need to be addressed but we wanted to focus on the outstanding monitoring issues immediately.

As we discussed at our last meeting and in further discussions internally, we have incorporated the following parameters for the monitoring plan:

Parameter	Current Plan
Solar Field- % coverage for monitoring	25%
Solar Field- frequency of searches	Every 7 days during migration and every 21 days during non-migration
Fenceline- % coverage for monitoring	100% (same frequency as solar field)
GenTie- % coverage for monitoring	50% (same frequency as solar field)
Evaporation Pond monitoring	100% (same frequency as solar field)
Power Block Monitoring	100% of perimeter (same frequency as solar field)
Duration of monitoring	minimum of 2 years
Bias trials – array, fenceline, evaporation pond and gentie	Yes searcher efficiency and Yes carcass removal trials

Please let the Genesis team know of any comments or questions that you have so that we may get the plan finalized as soon as possible. As always, we appreciate your assistance in continuing to move this process forward.

The attached BBCS is currently in pdf format given the size of the original WORD file and I wasn't sure if any of you had a size limit on emailed documents. The Word version can be made available.

Hello everyone,

There were two avian mortalities documented over the weekend and one yesterday:

- 26 April 2014 - The carcass of a White-winged dove was found on Center line drive underneath transmission lines. The bird was located at 0500 and when it was check at 0730, unknown scavengers had removed the carcass.

- 27 April 2014 - The carcass of a Townsend's Warbler was found on West Side Drive underneath transmission lines. The bird was located at 0930. It was left in place and when it was checked at 0800 the following day, unknown scavengers had removed the carcass.

- 28 April 2014 - The wing of an unidentified duck was located in Block 7, Array 7, Row 55 within solar array framework. It was collected and stored in the freezer in the bio office.

If you have any questions please contact me.

Thanks,

Tom,

The TOWA was left overnight because it was found sunday morning by Operations and Management (O&M). Sunday's there are only a couple O&M workers doing maintenance in random shelters on site. These are the only personnel on site. They do not have the protocols for carcass collection or a freezer to store the bird. I had them take photos and give me the exact location and I checked it first thing Monday morning. It was less than 24 hours and the bird had been removed.

The White-winged dove was found by a security guard at 0500. By 0700 the carcass had been removed by scavengers and again I had nothing to collect.

I've attached a photo of the UNBI wing. I have some ideas what it is but without knowing for sure I didn't want to document wrong. I've also passed images on to folks who will be letting me know what it is and the data will be updated once it is identified correctly. Let me know if your people identify it. I'm curious.

Thanks for your interest and question. Feel free to contact me anytime.

Brian

Hi Brian,

Thank you for the report. Can you tell me why you left the carcasses overnight? Also, can you send me a spread wing view picture of the unidentified duck wing (top and bottom)? I know some waterfowl biologists that can identify the species by wing.

Thanks, Tom

Here are my comments. Some are just for you both, and some are in general comments that we may wish to include. We may wish to have an internal discussion asap.

The more carefully I read this bbcs, the more it clearly shows a bias for the company to NOT find birds and develop realistic estimators. We need to be careful here, as this plan WILL become the precedent and it is really hard to change precedent as we are seeing with Ivanpah. I would rather hold off and get a better plan, than let some of this mush go through and be implemented.

Hi Jody,

Here's the revised BBCS for Desert Sunlight. I've added or left in comments for us to discuss before we finalize the document.

Let's check in tomorrow AM or whenever you are in the office.

Thanks, Tom

Jody

Attached is the word version of the Genesis BBCS per your request. It is a 6 mb file, so let me know when you receive it.

In follow-up to our meeting on October 24th and related correspondence, attached is the revised Bird and Bat Conservation Strategy for the Genesis Project that is consistent with the recently submitted revised BBCS for Desert Sunlight. Because the Project is operational, we have updated the BBCS accordingly to focus on post-construction avian and bat fatality monitoring. We have included a comment and response document in a separate file that identifies the original REAT agency comments and includes responses to those comments. Given the large number of comments, and the change in format for the new BBCS, we provided reference to the sections in the March 2014 version of the BBCS as well as a reference in our response to the new section in this version of the BBCS where the comment was addressed. The comments related to pre-construction or construction activities were moved to the end of the Response document and most of these were not specifically addressed unless they indirectly or directly were related to the post-construction activities. There may be a few of these that still need to be addressed but we wanted to focus on the outstanding monitoring issues immediately.

As we discussed at our last meeting and in further discussions internally, we have incorporated the following parameters for the monitoring plan:

Parameter	Current Plan
Solar Field- % coverage for monitoring	25%
Solar Field- frequency of searches	Every 7 days during migration and every 21 days during non-migration
Fenceline- % coverage for monitoring	100% (same frequency as solar field)
GenTie- % coverage for monitoring	50% (same frequency as solar field)

Evaporation Pond monitoring	100% (same frequency as solar field)
Power Block Monitoring	100% of perimeter (same frequency as solar field)
Duration of monitoring	minimum of 2 years
Bias trials – array, fenceline, evaporation pond and gentie	Yes searcher efficiency and Yes carcass removal trials

Please let the Genesis team know of any comments or questions that you have so that we may get the plan finalized as soon as possible. As always, we appreciate your assistance in continuing to move this process forward.

The attached BBCS is currently in pdf format given the size of the original WORD file and I wasn't sure if any of you had a size limit on emailed documents. The Word version can be made available.

I had handwritten comments that I've now added to the proposal you sent me (attached).

This proposal said pretty much nothing. Distance sampling is not for the faint-hearted, I should know. So I think they should have explained why they think they will have enough data to do this correctly, and how they modified their study design to account for differences between their distance protocols and the strip-transect protocols used in the simulations.

Hi Jody,

Will this work for those two bolded sentences?

Effective search area includes the area from the perimeter to that distance from the end of the panel row where the fraction of birds detected for each target size class is above a set fraction (threshold) as determined through robust searcher efficiency trials. The BLM and Wildlife agencies prefer that the threshold detection rate be set to at least 0.6 - 0.8; however analysis of raw data and detectability curves by the agencies will ultimately determine the threshold detection rate will be used to evaluate effective search area.

From: Pagel, Joel [mailto:joel_pagel@fws.gov]
Sent: Thursday, November 20, 2014 4:59 PM
To: Thomas Dietsch; Jody Fraser; Pete Sorensen
Subject: my review... (in bold)

(i.e., 95- **+**100 degrees F) warrant driving in **open covered (buggies), and/or** air-conditioned vehicles. (pp 12)

sampling will encompass approximately **at least** 25% of the completed solar arrays as summarized in Table 1 unless or until data support changes in this sampling design. (pp 16)

Consequently, the effective area monitored is expected to be **substantially** less than 25%. Therefore, this will be corrected based on results of the distance sampling and detection function analysis (pp 17) (changed significantly to substantially)

Distance sampling **and resulting data** will be used to calculate detectability curves to **determine** the effective search area for these different panel configurations. **Effective search area characterizes the distance in from the end of the panel row where at least xx% of birds of the target size class are detected via robust trials. The BLM and Wildlife agencies would prefer a detection rate of at least 0.6 - 0.8; however analysis of raw data by the agencies will ultimately determine the target detection rate considered to be acceptable**. Due to potential differences in visibility based on the direction that the observer is moving (N or S) in relation to the South facing angle of the fixed panels (pp 17)

placement of searcher-efficiency trial specimens will be distributed throughout the year (appropriately organized to provide season-specific estimates with adequate samples per season/**per person** to provide a robust estimate of searcher efficiency), with few specimens placed at any one time. Carcasses will be placed carefully to minimize disturbance of substrates that may bias carcass detection. (pp 29)

Persons with scientific expertise may be invited by TAC members if deemed appropriate. In addition, representatives from the Project and the consultants involved in the conduct of

the studies **may be** invited attend and participate in meetings. (pp 38)

finally, I still strongly recommend that they search only north to south, versus having the ability to search north to south and south to north. Maybe this needs to go in the letter...

OK, here's the draft transmittal email and our "final" comments in track changes. I think I should attach a TAILS number to it since we've spent so much frickin' time on this...we should get credit for it!

This needs to go out asap on Friday, so don't dilly-dally.

Thanks, Tom and Jeep, for your deep commitment to these issues and helping me get through this. Your help is invaluable.

Amy,
Thank you for your patience as we worked through this plan (again). While you continue to reassure us that we will have opportunities in the future to perfect the methodology and extend the monitoring period, I'm sure you can understand our trepidation based on our experiences on ISEGS, Genesis, and the Imperial County projects.

Per your recommendation, we have made changes to the text (in track-changes) within the constraints (25% of the solar field, 100% of the fence line, and 50% of the gen-tie) established during various meetings with NE. The biggest issues for us are as follows:

- While we recognize that 2 years is the minimum time required for monitoring and the BLM has discretion to require additional years based on the incoming data, we remain concerned about this considering the project will be on the landscape for a minimum of 30 years. The species identified and the mortalities per species is likely to differ considerably between years and there is no way this variability will be captured in such a short time period.

- We are concerned that distance sampling has never been used for this application (mortality monitoring on wind and solar); the justification for using this methodology is not well supported in the document, i.e., the simulation they provide has not been peer-reviewed, nor was the citation included in the References section. We should have the ability to modify the methodology after the first year.

- We are concerned about the monitoring intervals (7 and 21 days), which are not supported by the Corvus carcass surveys performed on-site and much of the available literature. We strongly believe that the intervals coupled with the distance sampling method as proposed will result in significant undersampling, which cannot be corrected for using statistics.

- The References section does not reflect what was cited in the document; therefore, we were unable to understand some of the assumptions set forth in the plan.

- We are concerned about using observers who do not have academic ornithological and field ecology/biology background. We added language that requires an Authorized Avian Biologist to be on-site during monitoring to provide oversight.

- If there needs to be a TAC, it should be open to public participation so that the process is transparent.

- We know you are working on an IM that requires third-party monitoring that eliminates confidentiality agreements; facilitates open communication to wildlife agencies from all project-related staff; requires submission of all raw data and methods; and makes all data available for peer review and assessment. We support this wholeheartedly and would like to offer any assistance with/review of the draft document.

Please feel free to contact us with any questions you may have on our comments. And please do cc us on your transmittal to Wally, First Solar, and NextEra.
Thanks,
Jody

Amy,

Thank you for your patience as we have worked through this plan (again). As discussed, this document does not contain the necessary components of a BBCS and serves primarily as s a monitoring plan; additional work will need to be done to complete the BBCS. While you continue to reassure us that we will have opportunities in the future to refine the methodology and extend the monitoring period, I'm sure you can understand our trepidation based on our experiences on ISEGS, Genesis, and the Imperial County projects in that making changes once the monitoring has commenced has been very difficult.

Per your recommendation, we have made changes to the text (in track-changes) within the constraints (2-yr monitoring period, 25% of the solar field, 100% of the fence line, and 50% of the gen-tie) established during various meetings with NE. While we still assert that 25% coverage of the solar field is insufficient, especially as proposed (i.e., using distance sampling), the biggest issues for us in this current iteration of the monitoring document are as follows. Hopefully, these points are considered as we move forward with this and other projects:

- While we recognize that 2 years is the minimum time required for monitoring and the BLM has discretion to require additional years based on the incoming data, we remain concerned about this considering the project will be on the landscape for a minimum of 30 years. The species identified and the mortalities per species are likely to differ considerably between years and there is no way this variability will be captured in such a short time period. We recommend that periodic monitoring of the facility (panel area, gen-tie, and fence line) is performed at various increments for the life of the project, especially as other projects go online in the desert; this will allow us to better understand and evaluate cumulative impacts and the contribution of this facility to overall avian impacts.

- We are concerned that distance sampling has never been used for this application (mortality monitoring on wind and solar); the justification for using this methodology is not well supported in the document or by the detectability study that HT Harvey ran on the Desert

Sunlight site (attached). Furthermore, many citations were not included in the References section, making evaluation difficult. The proposed plan is a hybrid of distance sampling and wind energy mortality monitoring methods that are based on different and not necessarily compatible assumptions. Nonetheless, we have made our changes in consultation with known distance sampling and mortality monitoring experts and would encourage that independent experts be included in discussions before any further revisions are made to the methodology. After some evaluation period, we should have the ability to modify the methodology, if necessary.

- We remain concerned about the monitoring intervals (7 and 21 days), which are not supported by the Corvus carcass surveys performed on-site, HTH's detectability study, and much of the available literature. We believe that these intervals coupled with the distance sampling method as proposed will result in significant under-sampling, which cannot be corrected for using statistics. Additionally, as proposed, surveys are unlikely to capture rare mortality events of uncommon and/or listed species, such as Yuma Ridgway's (clapper) rail.

- The References section does not reflect what was cited in the document; therefore, we were unable to understand some of the assumptions set forth in the plan.

- We remain concerned about using surveyors who do not have academic ornithological and field ecology/biology background. While training will be conducted, locating carcasses can be quite difficult, especially using distance sampling. Therefore, we added language that requires an Authorized Avian Biologist to be on-site during monitoring to provide oversight.

- If there needs to be a TAC, it should be open to public participation so that the process is transparent. We recommend seeking input from academic and NGO partners, as well as other consultants who have the appropriate expertise.

- We know you are working on an IM that requires third-party monitoring that eliminates confidentiality agreements; facilitates open communication to wildlife agencies from all project-related staff; requires submission of all raw data and methods; and makes all data available for peer review and assessment. We support this wholeheartedly and would like to offer any assistance with/review of the draft document.

We know time is short, but we would like to have a conversation should you have any questions or concerns about our comments. And please do cc us on your transmittal to WEST, First Solar, and NextEra.
Thanks,
Jody

FYI. Our most recent round of comments on First Solar/NextEra's mortality monitoring plan for Desert Sunlight. As I told Ed yesterday, we've been going back and forth with this applicant on this project, Genesis, Blythe, and McCoy for some time. And unfortunately, we are being constrained by agreements the BLM has made with the applicant on duration, coverage of the site, etc. Pretty frustrating.
Let me know if you have any questions,
Jody

We recommend that periodic monitoring of the facility (panel area, gen-tie, and fence line) is performed at various increments for the life of the project, especially as other projects go online in the desert; this will allow us to better understand and evaluate cumulative impacts

and the contribution of this facility to overall avian impacts.

- We are concerned that distance sampling has never been used for this application (mortality monitoring on wind and solar); the justification for using this methodology is not well supported in the document or by the detectability study that HT Harvey ran on the Desert Sunlight site (attached). Furthermore, many citations were not included in the References section, making evaluation difficult. The proposed plan is a hybrid of distance sampling and wind energy mortality monitoring methods that are based on different and not necessarily compatible assumptions. Nonetheless, we have made our changes in consultation with known distance sampling and mortality monitoring experts and would encourage that independent experts be included in discussions before any further revisions are made to the methodology. After some evaluation period, we should have the ability to modify the methodology, if necessary.

- We remain concerned about the monitoring intervals (7 and 21 days), which are not supported by the Corvus carcass surveys performed on-site, HTH's detectability study, and much of the available literature. We believe that these intervals coupled with the distance sampling method as proposed will result in significant under-sampling, which cannot be corrected for using statistics. Additionally, as proposed, surveys are unlikely to capture rare mortality events of uncommon and/or listed species, such as Yuma Ridgway's (clapper) rail.

- The References section does not reflect what was cited in the document; therefore, we were unable to understand some of the assumptions set forth in the plan.

- We remain concerned about using surveyors who do not have academic ornithological and field ecology/biology background. While training will be conducted, locating carcasses can be quite difficult, especially using distance sampling. Therefore, we added language that requires an Authorized Avian Biologist to be on-site during monitoring to provide oversight.

- If there needs to be a TAC, it should be open to public participation so that the process is transparent. We recommend seeking input from academic and NGO partners, as well as other consultants who have the appropriate expertise.

- We know you are working on an IM that requires third-party monitoring that eliminates confidentiality agreements; facilitates open communication to wildlife agencies from all project-related staff; requires submission of all raw data and methods; and makes all data available for peer review and assessment. We support this wholeheartedly and would like to offer any assistance with/review of the draft document.

We know time is short, but we would like to have a conversation should you have any questions or concerns about our comments. And please do cc us on your transmittal to WEST, First Solar, and NextEra.
Thanks,
Jody

LIST OF APPENDICES

Appendix A. Incidental Bird and Bat mortalities and injuries previously reported during construction of Desert Sunlight Solar Farm Project as of October 31, 2014~~Most Frequently Reported and Size Categories of Bird Species on e-Bird (eBird 2014) in Riverside County, California~~

Appendix B: Desert Sunlight Wildlife Incident Reporting System (WIRS)

1.0 INTRODUCTION

Desert Sunlight 250, LLC and Desert Sunlight 300, LLC (collectively, Desert Sunlight), has constructed and will operate the Desert Sunlight Solar Farm Project (Project), which consists of two main components: 1) a 550-megawatt (MW) photovoltaic (PV) generating facility; and 2) a 220-kilovolt (kV) generation interconnection (Gen-tie) line. The Project comprises approximately 1,700 hectares (ha; 4,200 acres) of land administered by the Bureau of Land Management (BLM) six miles north of Desert Center in Riverside County, California (Figure 1).

Information on pre-construction site conditions, avian and bat species present at the Project, risk assessment, and conservation measures implemented during pre-construction and construction phases are found in the Project's ~~approved~~ proposed "Avian and Bat Protection Plan, Desert Sunlight Solar Farm Project, BLM Case File Number CACA-48649, Riverside County, California" (Ironwood Consulting 2011). The Avian and Bat Protection Plan (ABPP) was included as part of Appendix H in the Desert Sunlight Solar Farm Project, California Desert Conservation Area Plan Amendment and Final Environmental Impact Statement (USDI BLM 2011) and the Project received a Record of Decision from the Secretary of the Department of the Interior on August 09, 2011. Avian and Bat Protection Plans have since been renamed, and are presently known as Bird and Bat Conservation Strategies (BBCS~~s~~). This BBCS replaces the ABPP and was developed in coordination with BLM to provide a written record of the Project's post-construction efforts to monitor potential project impacts to birds and bats and to document conservation measures that have been or will be taken to avoid, minimize, and/or mitigate for potential impacts. After introductory material on project description, the BBCS purpose, and regulatory framework, this BBCS addresses post-construction monitoring and adaptive management.

Figure 1. Location of the Desert Sunlight Solar Farm Project, Riverside County, California.

1.1 Purpose

This document represents one chapter of the proposed BBCS for Desert Sunlight. The primary purpose of this ~~BBCS~~ Avian Fatality Monitoring Plan is to describe post-construction monitoring protocols ~~and adaptive management intended to avoid, minimize, and/or mitigate potential impacts to~~to identify the extent of mortality and injury to bird and bat species. Information from this plan will augment the ~~in this~~ BBCS, which is intended to guide the implementation of avoidance, minimization, and mitigation measures identified in the Project's approval documentation, and includes the following objectives:

- Identify construction and operational activities that may increase potential adverse effects to avian and bat species on and adjacent to Project components;
- Specify steps that will be taken to avoid, minimize, and mitigate any potential adverse effects on these species; articulate monitoring methods to determine effectiveness; and identify contingency measures;
- provide details for an Avian Fatality Monitoring ~~Study~~ Plan to be conducted post-construction, including applicable approved protocols that would be used for any surveys and/or monitoring conducted; and
- ~~detail long-term monitoring and reporting goals for the Project.~~

Comment [USFWS 1]: These should be in the BBCS, but are considerably lacking and should be re-constructed, and better described in the BBCS.

Comment [FWS2]: Extraneous info that is stated in other docs.

~~1.2 Regulatory Setting~~

~~Several federal and state laws and regulations, including National Environmental Policy Act (NEPA), the Endangered Species Act (ESA), the Migratory Bird Treaty Act (MBTA), the Bald and Golden Eagle Protection Act (BGEPA), and California Endangered Species Act, provide the foundation for the development of this BBCS.~~

~~*1.2.1 National Environmental Policy Act*~~

~~Under NEPA (42 United States Code [USC] §§ 4321-4370h), federal agencies are required to prepare an environmental impact statement (EIS) for any major federal action significantly affecting the quality of the human environment. An EIS must include an examination of the environmental impacts of a proposed project, a reasonable range of alternatives for a project, and other related matters. The environmental impacts of the Project have been addressed in the Final EIS and ROD (BLM 2011a,b). This BBCS implements Mitigation Measure (MM) WIL-5 in the Project's ROD.~~

~~*1.2.2 Endangered Species Act*~~

~~Certain species at risk of extinction, including many birds and bats, are protected under the federal ESA. The ESA defines and lists species as "endangered" and "threatened" and provides regulatory protection for the listed species. The ESA provides a program for conservation and recovery of threatened and endangered species. Section 7(a)(2) of the ESA directs all federal agencies to insure that any action they authorize, fund, or carry out does not jeopardize the~~

~~continued existence of an endangered or threatened species or destroy or adversely modify designated or proposed critical habitat (collectively, referred to as protected resources).~~

~~*1.2.3 Migratory Bird Treaty Act*~~

~~The MBTA (16 USC §§ 703, *et seq.*), makes it unlawful to "pursue, hunt, take, capture or kill; attempt to take capture or kill; possess; offer to or sell, barter, purchase, or deliver; or cause to be shipped, exported, imported, transported, or received any native migratory bird, part, nest, egg, or product." The MBTA, enforced by USFWS, protects all MBTA-listed migratory birds within the United States. In the continental U.S., native non-covered species generally belong to the Order Galliformes. Common non-native species not protected by the MBTA include rock pigeon (*Columba livia*), Eurasian collared-doves (*Streptopelia decaocto*), European starling (*Sturnus vulgaris*), and house sparrow (*Passer domesticus*; USFWS 2005). Although permits may be obtained to collect MBTA-listed birds for scientific purposes or to destroy depredating migratory birds, the MBTA does not provide any permit mechanism authorizing the incidental take of migratory birds in connection with otherwise lawful activities. Nevertheless, federal agencies such as the BLM have been directed to evaluate the effects of its actions on migratory birds, with an emphasis on species of concern (per Executive Order 13186).~~

~~*1.2.4 Bald and Golden Eagle Protection Act*~~

~~The BGEPA (16 USC §§ 668-668d) prohibits the take, defined as "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest, or disturb," of any bald eagle (*Haliaeetus leucocephalus*) or golden eagle (*Aquila chrysaetos*). Through recent regulation (50 Code of Federal Regulations [CFR] § 22.26; USFWS 2009), the USFWS can authorize take of bald and golden eagles when the take is associated with, but not the purpose of, an otherwise lawful activity and cannot practicably be avoided. The USFWS has issued Eagle Conservation Plan Guidance (USFWS 2013a) for land-based wind energy projects to help project proponents avoid unanticipated take of bald and golden eagles and comply with the BGEPA. Although the guidelines were developed for land-based wind energy projects, certain components of eagle surveys and monitoring are applicable to other renewable energy projects, including PV solar plants, and have been incorporated into this BBCS as appropriate.~~

~~*1.2.5 California Department of Fish and Game Codes*~~

~~CDFG Code Sections 2050-2085 – These codes encompass the applicable declarations and definitions of the California Endangered Species Act (CESA).~~

~~CDFG Code Sections 3503 and 3503.5 – These codes state that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird (including birds of prey) or take, possess, or destroy birds of prey, except as otherwise provided by this code or any regulation made pursuant thereto.~~

~~CDFG Code Sections 3511, 4700, 5050, and 5515 – These state laws classify and prohibit the take of "fully protected" bird, mammal, amphibian/reptile, and fish species in California.~~

~~CDFG Code Section 3513 – This code prohibits any take or possession of birds that are designated by the MBTA as migratory non-game birds except as allowed by federal rules and regulations promulgated pursuant to the MBTA.~~

~~CDFG Code Section 4150 – This code defines all mammals that naturally occur in California as non-game mammals with exceptions for those defined as game mammals, fully protected mammals, or fur-bearing mammals. Non-game mammals or parts thereof may not be taken or possessed except as otherwise provided by this code or any regulation made pursuant thereto.~~

~~1.3 Corporate Policy and Coordination~~

~~Desert Sunlight maintains a commitment to work cooperatively to minimize adverse impacts to protected bird and bat species. Through the planning and construction stages of the Project, Desert Sunlight and its contractors and consultants worked in coordination with federal and state agency personnel regarding necessary wildlife surveys, siting considerations, mitigation measures and adaptive management to ensure that potential issues that could affect bird and bat species were identified as early as possible in the planning process and addressed through appropriate design, mitigation and adaptive management measures. Desert Sunlight will continue to work with the agencies to implement conservation measures intended to avoid, minimize, and/or mitigate potential impacts to bird and bat species, including those measures identified in this BBCS.~~

2.0 PROJECT DESCRIPTION

The Project is a PV solar power plant being developed on approximately 1,700 ha (4,200 acres) of public land administered by the BLM in Riverside County, California, approximately 9.7 km (~~six~~ 6 miles) north of the rural community of Desert Center (Figure 1). Project construction is anticipated to be concluded on or about January 2015. The Project consists of two main components: 1) a 550 MW PV generating facility (Solar Farm) of solar equipment; and 2) a 220 kV Gen-tie Line. More specifically, the Solar Farm consists of 466 individual PV arrays, with each array occupying 2.4 to 2.8 ha (6 to 7 acres) and consisting of rows of PV panels supported on steel posts, a power conversion station, and a transformer. High-capacity 34-kV collection lines will transfer power output from the PV arrays to the onsite substation via overhead lines. The total acreage of the Project (including the Gen-tie Line) is 4,085 acres (1,653 ha). A chain-link fence topped with barbed wire encloses the entire Solar Farm, including support facilities (encompassing approximately 3,697 acres [1,496 ha]). The solar arrays cover 2,984 acres (1,208 ha).

In addition to the PV generating facility, other primary Project features include an operations and maintenance (O&M) building, visitor center, parking areas, access roads, fiber-optic lines, water wells, wastewater treatment facilities, an onsite electrical substation, and the 220 kV Gen-tie Line connecting the Project to the power grid.

Project features -- including solar panels, overhead electrical feeder and distribution lines, the Gen-tie Line, temporary retention basins, and the perimeter security fence -- pose potential

mortality and injury risks to birds and bats. This BBCS focuses on permanent Project infrastructure elements including the solar panel arrays, perimeter fence and the Gen-tie Line. To minimize the threat of electrocution and collision, the Project's electrical distribution infrastructure is being built to avian-safe standards following Avian Power Line Interaction Committee (APLIC) guidelines (APLIC 2005, 2006, 2012). Should birds or bats collide with the on-site distribution powerlines, injuries and fatalities will be documented during sampling of the solar arrays, as well as incidentally by Project staff during other activities.

3.0 SITE CHARACTERIZATION

The Project site is located in a relatively flat, previously undeveloped area of Chuckwalla Valley in eastern Riverside County. It is approximately 9.6 km (5.9 mi) north of Interstate 10 and the rural community of Desert Center, between the cities of Coachella to the west and Blythe to the east. Joshua Tree National Park wraps around the Project site to the west, north, and east; at its closest point, the Project is approximately 2.2 km (1.4 miles) southwest of the park boundary. Lake Tamarisk, a small golf-resort community, is approximately 6.4 km (four miles) to the south. The inactive Kaiser Eagle Mountain Mine is approximately 1.6 km (one mile) to the west.

The Project site is in the Colorado Desert Bioregion, which is the western extension of the Sonoran Desert of southern Arizona and northwestern Mexico. The Mojave Desert, which includes portions of Joshua Tree National Park, lies immediately north of the Project area. Chuckwalla Valley encompasses a series of alluvial fans that gently slope toward the southwest and southeast.

The 2011 FEIS prepared for the Project (BLM 2011a) describes the biological setting of the Project area. The FEIS included the results of biological surveys conducted in areas of potential impact associated with the Solar Farm, Gen-tie Line, Red Bluff Substation, and possible alternative sites (all collectively referred to as the Biological Study Area [BSA]). Before construction began on the Project, vegetation in the BSA consisted of Sonoran creosote (*Larrea tridentata*) bush scrub and desert dry wash woodland communities. To prepare for installation of the solar arrays, the Solar Farm site was disked and rolled, such that the Project landscape is now relatively flat and uniform, with vegetation re-establishing on the site. Stabilized sand sheets and pockets of sand dune deposits are located to the east of the Project area, but the Solar Farm site lacks wind-blown sand formations. Disturbed and developed areas that are either barren or dominated by ruderal vegetation occur primarily along roadsides. Agricultural areas, mostly fallow jojoba (*Simmondsia chinensis*) farms, are located southeast of the Project site.

Two temporary 0.4-ha (1-acre) ponds provided water during construction of the Project. One of the ponds was removed, and the second pond will be removed by the end of 2014. Several retention basins, which may hold water for some time after a storm event, are located within the Project's perimeter security fence, along the western upstream boundary and on the southeastern downstream boundary. An open portion of the Colorado River Aqueduct runs around the north end of Chuckwalla Valley, from about 6 to 10 km (4 to 6 miles) north of the

Project site. An aquaculture facility, covering approximately 24 ha (60 acres), lies about 3 km (2 miles) south of the Project site and contains perennially open water. The community of Lake Tamarisk includes homes, a golf course, and a small lake complex. The habitat structure and available water in this community routinely attract resident and migratory birds. All of these water features (when watered, in the case of the retention basins) ~~have the potential to~~can attract water-associated birds and shorebirds, either during migration stopover periods or in the course of local and intraregional movements.

As of Oct 31, 2014, 198 avian and bat injuries or mortalities have been documented on-site during incidental construction monitoring of the Project (Appendix A, First Solar 2014). Avian mortalities are being reported by construction workers and other staff incidental to their work activities. Consequently, the incidental nature of the data needs to be considered when evaluating the information reported to date. Incidentally collected data do not provide enough information to accurately quantify the scope of actual avian mortalities on a project site. However, these data can provide important information such as the composition of species which may be at risk in the future. In addition, the data provide insights into project features and types of injuries that may be associated with mortalities (U.S. Fish and Wildlife Service 2014). The majority of mortalities documented on the Project site are water-associated taxa (SPUT data).

Comment [FWS3]: Nov. 4, 2014 SPUT rept.

Figure 2. Desert Sunlight Solar Farm vicinity map.

4.0 POST-CONSTRUCTION MONITORING PLAN

This section outlines a standardized approach to document known and projected bird and bat fatalities and injuries, and to estimate seasonal and annual post-construction fatality rates associated with Project features. The Plan includes an approach to determine whether there are spatial patterns of fatality rates within the solar field (i.e.~~g.~~., different fatality rates near panels on the edge of the solar arrays vs. the interior area of the arrays). The Plan is consistent with the Bird Monitoring and Avoidance Plan outlined in the Project's FEIS (BLM 2011a), and builds on standards and guidelines developed for the electric-utility and renewable-energy industries to quantify the risk of fatality and injury for birds and bats that may result from interactions with energy-related infrastructure (e.g., Anderson et al. 1999; APLIC 2005, 2006, 2012; California Energy Commission [CEC] and CDFG 2007; USFWS 2010, 2012). In particular, the Plan outlines a statistically sound spatial and temporal sampling plan, including protocols for independently estimating and correcting for quarterly searcher-efficiency and seasonal (i.e., at least quarterly) scavenger (avian and mammalian) removal rates. It describes specific data to be collected during scheduled carcass searches, protocols for handling any dead or injured birds and bats that are found, and procedures for reporting incidents to relevant government agencies. The study design is compatible with the BLM (2011b) Record of Decision requirement (MM-WIL-05) that, after the study is ~~deemed~~ complete, Desert Sunlight will ultimately submit a description of the study design and monitoring results to peer-reviewed scientific journals.

4.1 Goals and Objectives

Primary goals of the post-construction fatality monitoring program are:

1. Estimate overall annual avian fatality rate and species composition associated with ~~unique aspects~~the primary features of the Project~~'s solar facilities~~infrastructure. This estimate should include mortality associated with solar arrays, overhead lines including the Gen-tie Line, perimeter fence and other features of the Project that are may result in injury and fatality.
2. Determine which species, subspecies, and regional populations are at risk from ~~primary~~ project ~~features~~infrastructure and whether there are spatial and temporal patterns of fatality rates within the solar field (e.g., different fatality rates near panels on the edge of the solar arrays vs. the interior area of the arrays) and other project infrastructure.

~~2.~~3. Measuring effects of the Project in the context of other solar facilities. Comparable methods (e.g., line-distance sampling) and a comprehensive species list should be used at each of the project sites and positive and negative data should be reported for each (i.e., for each species, the surveyors state that no sign was found, sign was found that was inconclusive of fatality, or actual fatality estimates). Using similar methodologies, a comprehensive species list, and consistent data collection are steps that would make results useful for comparison across sites.

These goals need to be structured in a way that provides information on seasonal differences in fatality rates, and information about which taxonomic groups are most vulnerable. ~~and may~~SAdditional surveys and data analysis may be required and/or modified in the future by the BLM as data become available.~~.~~ Fatality estimates need to be adjusted to address carcass persistence and searcher efficiency as they change through seasons. Additionally, carcass persistence ~~surveys~~ trials will inform search intervals, which may be modified by the BLM based on trial results.

~~-~~Consistent with the above goals, the specific objectives of this Plan are as follows:

1. Conduct fatality searches for a minimum of 2~~two~~ years according to a spatial and temporal sampling plan that provides representative and statistically sound coverage of the solar arrays, consistent with monitoring required of other industries. The need for additional m~~M~~onitoring beyond the second year will depend on an evaluation of the survey results from the first 2 years to determine if the goals of the monitoring program have been met ~~depend on and be limited to issues identified during the first two years of monitoring, if any, and be narrowly focused to correspond to any such issues~~ (see section 5.0, Adaptive Management). The need to extend the monitoring period will be determined by the BLM and FWS. Standardized monitoring, as approved by the BLM and FWS, ~~is anticipated to~~will commence within 30 days of after the commercial operation delivery (COD) date (anticipated January 2015). Standardized monitoring on public lands may be altered ~~by the BLM~~ if new concepts~~,~~ and methods are developed and adopted by the BLM and the ~~w~~Wildlife agencies.
2. Conduct statistically sound, seasonal assessments to quantify and evaluate searcher efficiency of each searcher, and support calculations of adjusted fatality rates that account for variation in searcher efficiency related to seasons, different searchers, habitat visibility ~~classes~~ (to the degree applicable), and carcass ~~type~~species/size classes.
3. Conduct statistically sound, seasonal assessments ~~(i.e., at least quarterly during the first year of monitoring)~~ to quantify and evaluate carcass removal rates (i.e., carcass removal, destruction including dismemberment, or burial in sand due to scavengers, decay, or other abiotic [e.g., wind] or human [e.g., vehicle activity] factors) and support calculation of adjusted fatality rates that account for variation in carcass removal rates by season and carcass type/size classes. Seasonal assessments will ~~be~~ be used to determine appropriate search intervals during each season.

4. Use current, scientifically validated and accepted methods for calculating fatality rates adjusted for searcher-efficiency, carcass removal rates, and spatial and temporal sampling intensity. At present, the best methods are distance sampling combined with searcher efficiency and carcass removal bias adjustments and a fatality estimator such as the Shoenfeld (2004) or Huso (2012) estimators, but it should be noted that fatality estimation is an area of active research and 'best methods' are changing rapidly. Therefore, as data are collected, adaptive management of the study design and monitoring protocol may be necessary, and will be done as directed by the BLM in consultation with the ~~w~~Wildlife agencies.
5. Evaluate all applicable data using Dalthorp et al 2014 regarding evidence of absence estimator to adjust survey parameters as needed.
6. Summarize the species composition of fatalities according to taxonomic family, ~~,~~ and ecological guild (e.g., raptors, water-associated birds, passerines, etc.) to determine species or groups at risk.
~~5.~~ To the extent possible, summarize the composition of fatalities according to their likely propensity to collide with project components during the day vs. during the night based on known migratory patterns for the particular species.
7. Evaluate potential causes and correlates by collecting data collected beyond that which is required under the SPUT. Data to be collected include the weight of whole birds recovered, known published migration periods, summaries of preceding weather conditions which would have made migration likely (i.e., low pressure systems moving cross continent to the north of the project area, followed by periods of high pressure systems).
~~6.~~8. Data summaries, ~~and~~ accompanying raw data, and any GIS shapefiles will be ~~reported~~submitted to the BLM and Wildlife agencies with each seasonal report.

4.2 Monitoring Methods

A monitoring program will be implemented for at least ~~two~~ 2 years post-construction as specified below. This monitoring period may be extended by the BLM based on data analysis, quality of raw and analyzed data, and assessment of field effort to collect that data. ~~The~~Survey results and analysis ~~ongoing monitoring~~ will inform adaptive management decisions regarding any additional appropriate and practicable BBCMs to avoid, minimize, and/or mitigate for observed impacts.

4.2.1 Post-Construction Monitoring of Solar Arrays

The fundamental characteristics of a sampling program designed to produce valid estimates of fatality rates for a solar farm (including the number of arrays to be searched, the search interval, the seasonal extent of coverage, and the number of years of sampling) are determined based on several factors. These factors include the questions of interest~~,~~; the species of interest (e.g., resident, migratory, and/or wintering species) in the Project area~~,~~; desired precision~~,~~; best estimates of carcass-removal rates~~,~~; searcher efficiency~~,~~; expected encounter rates (in addition to searcher efficiency), which affect whether distance curves can be built at all (minimum 60-80

required); the Project size and layout~~,~~; and other relevant environmental (i.e., seasonal patterns), landscape~~,~~; and habitat characteristics.

The following hierarchical terminology is useful for describing the spatial and temporal sampling design used to monitor solar arrays:

1) **Panel Cartridge:** An engineered assembly of solar panels installed as a single unit (approximately 2.5 x 2.9 meters [m; 8.2 x 9.5 feet (ft)]).
2) **Row:** A collection of panel cartridges arrayed side-by-side on a common, linear support structure (variable lengths ranging from approximately 71 to 142 m [232 to 464 ft]).
3) **Section or Subarray:** A collection of usually 20 commonly energized rows that represent one quarter of a typical array; dimensions (on the order of 71 x 84 m [232 x 274 ft]) are mostly uniform within blocks, but vary slightly among blocks; in most cases, structurally continuous rows span sections of two adjacent arrays.
4) **Array:** A collection of four sections connected to a common power converter station (PCS) and transformer, encompassing 2.4–2.8 ha (5.9-6.9 ac), depending on subsection dimensions and spacing between subsections (i.e., 466 total units in the Solar Farm).
5) **Block:** Collections of commonly energized arrays (20 blocks, each composed of 11–32 arrays).

4.2.2 Survey Strategy

Sampling strategies used in carcass searches have typically involved transect sampling, whereby searchers walk or drive along pre-defined transects and search for carcasses in a swath where width depends on visibility, target taxa, and other factors. The layout of PV facilities presents problems for a transect-sampling approach because rows of panels are close together (i.e., less than ~~five~~ 5 m [16 ft] at the Project). Because the panels are mounted off-horizontal, a searcher walking or driving a transect between two rows can only effectively search one side of the transect (a 2.5-m [8.2-ft] swath), and the other side is obscured by the edge of a PV cartridge. However, walking perpendicular to panel rows along the edges of the rows allows observers to see a greater distance of the ground beneath the panels. ~~Because the transect width is only 2.5 m, transects would need to be four to 12 times as long as if the width could be 10 – 30 m to maintain the same search area.~~ Surveyors will walk the lines unless temperatures (i.e., 95-100+ degrees F) warrant driving in open, covered (buggies) and/or air-conditioned vehicles. Should driving surveys be used, searcher efficiency trials will be conducted prior to implementation; results will be submitted and evaluated by the BLM and FWS within 2-weeks of completion of the trials to determine if conducting surveys using vehicles is acceptable. Other accommodations may be required to enable completion of surveys during high temperatures, such as shifting surveys to dawn and dusk.

~~-~~The layout of PV facilities is ~~are~~ well-suited to a distance-sampling approach. Distance sampling involves ~~searchers walking or driving~~searching a transect line and~~, but it departs from transect survey methodology in its assumptions about carcass detection along the transect. Distance sampling starts from the~~ ~~assume~~ption that searcher efficiency decreases (possibly

dramatically) as a function of distance from the observer, and is ideally suited to situations in which animals (or carcasses) are sparsely distributed across a landscape (Buckland et al. 1993). However, Freilich et al. (2005) found that this holds only if the survey effort results in enough sightings, i.e., if surveys were only sufficient to detect 24 desert tortoises, the distance estimates were not informative. The assumption herein is that ~~T~~the landscape at the Project is flat and relatively clear of vegetation, which ~~lends additional~~should support ~~to~~ a distance sampling design.

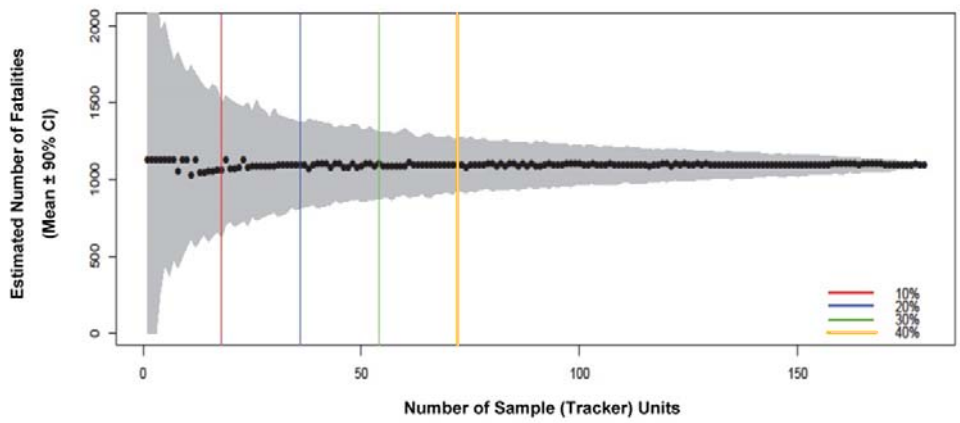
Comment [FWS4]: Freilich, J. E., R. J. Camp, J. J. Duda, and A. E. Karl. 2005. Problems with sampling desert tortoises: a simulation analysis based on field data. Journal of Wildlife Management 69:45-56.

Distance sampling adjusts carcass counts for variable searcher efficiency by accounting for the *effective* area searched along a transect. Effective area is the actual area multiplied by the probability of detection at that distance. As a highly simplified example, if a searcher walks a 10-m long transect line and detects 90% of all carcasses within 10-m of the line, and 60% of carcasses that are 10 to 20 m (33 to 66 ft) from the line, then the effective area between zero and 10 m would be $10\,m \times 10\,m \times 0.9 = 90\,m^2$ and the effective area searched between 10 and 20 m would be $10\,m \times 10\,m \times 0.6 = 60\,m^2$. For the total 10 by 20-m area, the adjustment factor would be $\frac{90\,m^2 + 60\,m^2}{100\,m^2 + 100\,m^2} = 0.75$. In practice, searcher efficiency is modeled as a continuous function of distance, and the detection function is estimated from the carcass data (as opposed to a bias trial). The searcher efficiency bias trials can be used to augment carcass data for the detection function. If the detection function calculated from the bias trials differs from the detection function calculated from the carcass data, this suggests non-random distribution of carcasses within the arrays, and simultaneously provides an adjustment factor to account for non-random distribution of carcasses. Preliminary data from the California Valley Solar Ranch (CVSR) suggests that non-random carcass distribution may not be a problem at PV solar facilities (H.T. Harvey and Associates 2014). One advantage to a data-driven detection function is that it is not necessary to specify a transect width: the detection function includes information about the distance at which searcher efficiency drops to zero. The detection function should be used to determine the effective search area for the study.

4.2.3 Spatial Sampling Design

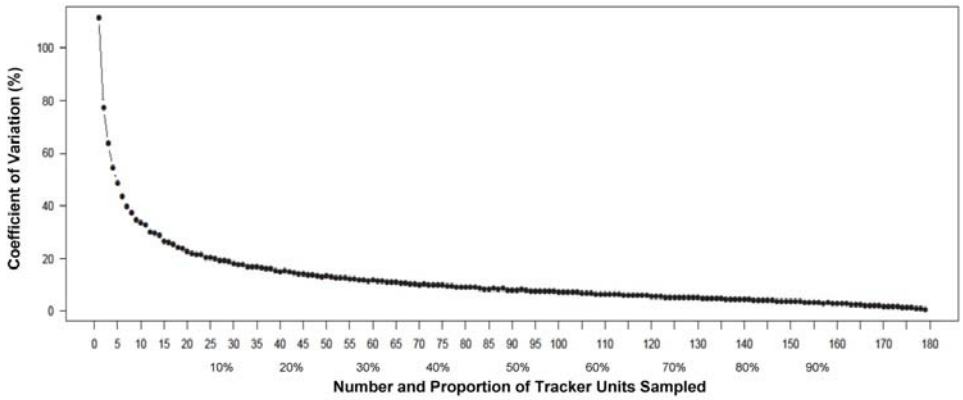
~~Recent statistical power and precision analyses conducted for another solar project being built roughly 193 km (120 miles) north of the Project site provides some guidance for developing a spatial sampling regime (TerraStat Consulting Group 2013). These simulations were based on projected sampling across an entire 392 MW solar thermal facility, so the results may not accurately reflect the expectation at facilities of different sizes or where sampling is constrained to smaller portions of a large facility; nevertheless, the general guidance they provide is useful. The simulation analyses were parameterized based on several wind-energy studies conducted in the Mojave Desert, and incorporated one of several well-studied mathematical approaches for estimating fatality rates adjusted for proportion of area sampled, search interval, searcher efficiency, and carcass persistence (Shoenfeld 2004). The power analyses assessed the effect of varying the proportion of area sampled from 1% to 30%, using search intervals of 7, 21, and 25 days, and simulating four hypothetical mortality rates (0.5, 1.0, 5.0, and 10 fatalities/MW/year), assuming exponentially distributed carcass removal rates with means of 7.4 or 21.8 days and searcher efficiencies of 0.55 and 0.69 for small and large birds, respectively.~~

Comment [FWS5]: Extraneous information that did not influence any decisions about the methodology.



The simulation results indicated that the 90% confidence interval for the facility-wide fatality estimate narrowed as the survey area increased, as the search interval decreased, and as the simulated mortality rate increased. The coefficient of variation (CV: $100\% \times \frac{standard\ deviation}{mean}$) provides a way to evaluate the relative amount of imprecision in an estimate. The CV is useful because it doesn't depend on the size of the estimate and so can be compared between large and small estimates. Larger values of CV are associated with estimates that are less precise: a CV of 100% indicates an estimate with a standard deviation that is equal to the mean. At all of the simulated mortality rates, and based on a 21-day search interval, the CV for the fatality estimates approached an asymptote once the proportion of area searched reached about 20%. In addition, at the 20% sample level, the CV for the fatality estimates was less than 25% for mortality rates that exceeded 1.0 fatality/MW/year. This level of precision generally is considered adequate for answering the primary questions of interest in such fatality studies (Strickland et al. 2011), and is consistent with guidance from the USFWS Land-Based Wind Energy Guidelines (2012), which states that "the carcass searching protocol should be adequate to answer applicable Tier 4 questions at an appropriate level of precision to make *general* conclusions about the project, *and is not intended to provide highly precise measurements of fatalities*" (p. 45; emphasis added). At the lowest simulated mortality rate, with a 21-day search interval, the coefficient of variation was above 50% at 20% of area sampled, which would be considered a marginal precision level for answering the questions of interest. From a practical standpoint, the importance of precision is diminished if impacts are low. For example, if the take estimate is 0.1 bird per year with 200% CV, this suggests a 90% confidence interval of about (0, 0.4), or a range of less than half a bird per year. On the other hand, if the take estimate is 100 birds per year and the CV is 20%, the 90% confidence interval is (61, 139), or a range of 78 birds per year.

At the lower simulated mortality rates, increasing the proportion of area sampled from 20% to 30% had less impact on the precision compared to decreasing the search interval from 21 days to 7 days. For the two highest simulated mortality rates, however, varying the search interval had less effect on the precision of the adjusted fatality estimates, whether based on 20% or 30% of area sampled, with the CVs remaining between about 8% – 19%. At the 1.0 fatality/MW/year mortality rate with 20% of the area sampled, the CV increased from about 25% with a 7-day search interval to about 40% with a 21-day search interval. At the 0.5 fatalities/MW/year mortality rate with 20% of the area sampled, the relevant change in the CV was from 37% to 57%.



Analysis of data from the CVSR in San Luis Obispo County, California (H.T. Harvey and Associates 2014) corroborates the simulation results. The CVSR is a recently completed 250-MW facility comprising nine discrete photovoltaic solar arrays, which collectively cover approximately 642 ha (1,586 acres) of primarily degraded annual grassland. Beginning in fall 2012, 100% of two arrays were surveyed weekly for bird and bat fatalities using 50-foot transects for large birds and 20-foot transects for bats and small birds. A total of 175 avian fatalities was found during standardized surveys in the two arrays over 10 months. The Huso (2010) estimator was used to estimate the number of fatalities based on documented fatalities adjusted for searcher efficiency and carcass persistence.

~~Two methods were used to evaluate the potential effects of reduced search area on fatality estimates at CVSR. Spatial clustering of fatalities was evaluated using Global Moran's I index, which indicates whether objects are clumped, uniform, or random in their spatial distribution (ESRI ArcInfo 10.0, geographic statistical toolbox). Spatial clumping of fatalities within the individual arrays would introduce additional uncertainty into the fatality estimates if sampling covered considerably less than 100% of the survey area. The second method involved resampling the observed fatality data to generate distributions of fatality estimates that would have resulted from searching less than 100% of the study area. Sample sizes varied from one sample unit up to the total number of sample units in the study area (180). (At CVSR, a sample unit was one "tracker unit," a group of 18 rows of solar panels covering approximately 0.34 ha (0.85 acres); sample units at CVSR were about a quarter the size of the proposed sample units at Desert Sunlight.) For each sample size, 2,000 simulated datasets were generated from the original data. Then, for each simulated dataset, the total number of fatalities for the study area was calculated by scaling the sample count according to the proportion of area represented in the sample. This procedure resulted in a distribution of possible fatality estimates for each level of area sampled. Based on these distributions, means, 90% confidence intervals (CI), and CVs were calculated for each sample size to evaluate the effect of sampling variation on the magnitude and precision of the fatality estimates.~~

~~The geospatial analysis indicated that the distribution of fatalities in the two, 100% searched arrays did not differ significantly from a random distribution (H.T. Harvey and Associates 2014). Results of the resampling analysis indicated that the mean fatality estimates and the 90% CIs for those estimates stabilized at about 20% of area sampled (Figure 3). Examined in a different way, the results indicated that the CVs of the sample distributions declined with increasing sample size and that, again beyond about 20% of area sampled, further increases in area sampled resulted in only small increases in precision (Figure 4). Moreover, at the 20% sample level, the CV for the fatality estimates was well below 20%, which is a level of precision that is considered adequate for answering the primary questions of interest in such fatality studies (Strickland et al. 2011, USFWS 2012). With regard to applying these results to other sites, it is important to note that the results may be sensitive to: 1) the relative proportions of large and small birds represented in the fatality sample, which were combined for this analysis; 2) the number and distribution of fatalities across the site; and 3) the influence of variation in searcher efficiency and carcass persistence.~~

~~**Figure 3. Resampling results from the California Valley Solar Ranch illustrating how the accuracy and precision of fatality estimates and varies with proportion of area sampled.**~~

~~**Figure 4. Resampling results from the California Valley Solar Ranch illustrating how the coefficient of variation for fatality estimates varies with proportion of area sampled.**~~

Based on ~~the simulation analyses, data from CVSR,~~ consultation with ~~relevant~~ permitting and Wildlife agencies~~, and consideration of the characteristics of this particular Project~~, sampling will encompass approximately a minimum of 25% of the completed solar arrays as summarized in ~~(~~Table 1 unless or until data support changes in this sampling design.~~)~~.

Table 1. Solar array sampling area characteristics.

Total area	1,208 ha
Proportion sampled	25%
Sampling unit	~2.6-ha spatial equivalent of 1 array

Number of sampling units (whole facility)	466
Migration season search interval (~~March~~ February 15 thru May 31, ~~September~~ August 1 thru ~~October~~November 15)	7 days unless adjusted by BLM and ~~w~~Wildlife agencies based on results carcass persistence trials.
Non-migration season search interval (June 1 thru ~~August~~July 31, November 16 through Feb 14)	21 days unless adjusted by BLM and ~~w~~Wildlife agencies based on results of carcass persistence trials.
Anticipated surveys per year	30
Duration of sampling	2 years with potential modifications after 1 year or when required by the BLM and ~~w~~Wildlife agencies

Because both the layout of the solar arrays and the landscape of the Solar Farm (i.e., mostly flat and free of vegetation) are largely uniform, a relatively simple random sampling design is likely to be adequate for sampling the arrays. However, in the absence of data, a spatially balanced sampling design will be used. Because spatially balanced designs ensure that sample effort is distributed over the whole study area, they help to ensure that spatially organized trends in mortality–should they exist-- can be extracted from the data. The drivers of spatial variation in avian activity ~~are not important to~~may be important to the statistical sampling design if avian use patterns affect the distribution of mortalities on the project site. ~~but a~~As an example, ~~two~~ factors that may affect avian use patterns ~~are~~include: 1) habitat variation around the Project site; ~~or~~ 2) the possibility that distinct movement corridors variably concentrate birds over certain areas of the Project site (e.g., migrating or commuting water-associated birds); or 3) use of distribution lines (and other transmission line infrastructure) as roosting sites. Distribution lines within the solar field may also pose a collision risk to birds ~~within the solar field~~. To achieve spatially balanced sampling, the site will be divided into 10 approximately equal-sized sampling areas and sampling will be stratified among those areas. Sampling will also be stratified proportionally among areas with distribution lines and those without.

The sampling units for the surveys consist of areas equivalent in size to a single array, but because of the concatenation of panel rows across arrays, they may include conjoined sections from multiple individual arrays (Figure 5). Within sampling areas, individual sampling units will be randomly selected to compose a 25% sample (± 1–2%). However, because of the configuration of the Project, the proposed survey technique is not likely to capture 100% of the sampling areas due to low detectability within the panel field because monitors are searching from the ends of rows rather than walking down each row or every other row (i.e., as was done at CVSR). Consequently, the effective area monitored is expected to be significantly less than 25%. Therefore, this will be corrected based on results of the distance sampling and detection function analysis.

Observers will survey sampling units ~~by driving or walking along~~ from the outer edges of collections of continuous solar panel rows and scanning between each row for fatalities, with each side-specific survey covering half the width of the sampling unit (Figures 5 and 6). Surveys will occur along roadways that run approximately north–south (consistent with the “Bio Blitz” report; USFWS 2013) through the middle of most arrays and along the outer edges of some arrays. Most sampling units consist of combined array sections from four adjacent arrays. In

most cases, the four sections run together both north to south and east to west, forming a continuous block composed of 40 continuous panel rows that are approximately 140 m- (460-ft) long. In these cases, two north-south routes will comprise the sampling-unit survey, with each route involving scanning across a maximum of 70 m (230 ft; Figure 5). Other sampling units have an additional roadway and powerline corridor running through the middle, such that the sampling unit consists of two subsections, each composed of 40 panel rows that are approximately 70 m long. In these cases, four north-south routes will comprise the sampling unit survey, with each route involving a maximum scanning distance of 35 m (115 ft) covering half the width of a subsection (Figure 5). For a few other sampling units with different layouts along the perimeter of the Solar Farm, ~~a hybrid survey scenario will apply~~the analysis will need to take into account the potentially different row lengths. Distance sampling and resulting data will be used to calculate detectability curves to calculate the effective search area for these different panel configurations. The effective search area includes the area from the perimeter to that distance from the end of the panel row where the fraction of birds detected for each target size class is above a set fraction (threshold) as determined through robust searcher efficiency trials. The BLM and Wildlife agencies prefer that the threshold detection rate be set to at least 0.6 - 0.8; however, analysis of raw data and detectability curves by the agencies will ultimately determine the threshold detection rate that will be used to evaluate effective search area. Also, ~~D~~due to potential differences in visibility based on the direction that the observer is moving (N or S) in relation to the south-facing angle of the fixed panels, detectability needs to be calculated for the each direction that the observers moved during transects.

~~-~~Given the results of the initial detectability field trial, the expectation is that effective sampling for ~~medium and~~ larger birds (1000+ grams) ~~(Appendix A)~~ will extend the full width of all sampling units, whether composed of 140-m or 70-m long panel rows. For smaller and medium sized birds (0-100 grams and 101-999 grams) and bats, however, effective sampling is expected to be constrained to less than the maximum viewing distance. Density estimation using distance sampling techniques is easier, and can be accomplished with greater precision if the data are truncated at a distance beyond which the probability of detection is low (Buckland et al. 1993). Accordingly, data will be truncated and the density of carcasses in the effective search area will be used to calculate the density of carcasses in the whole solar facility.

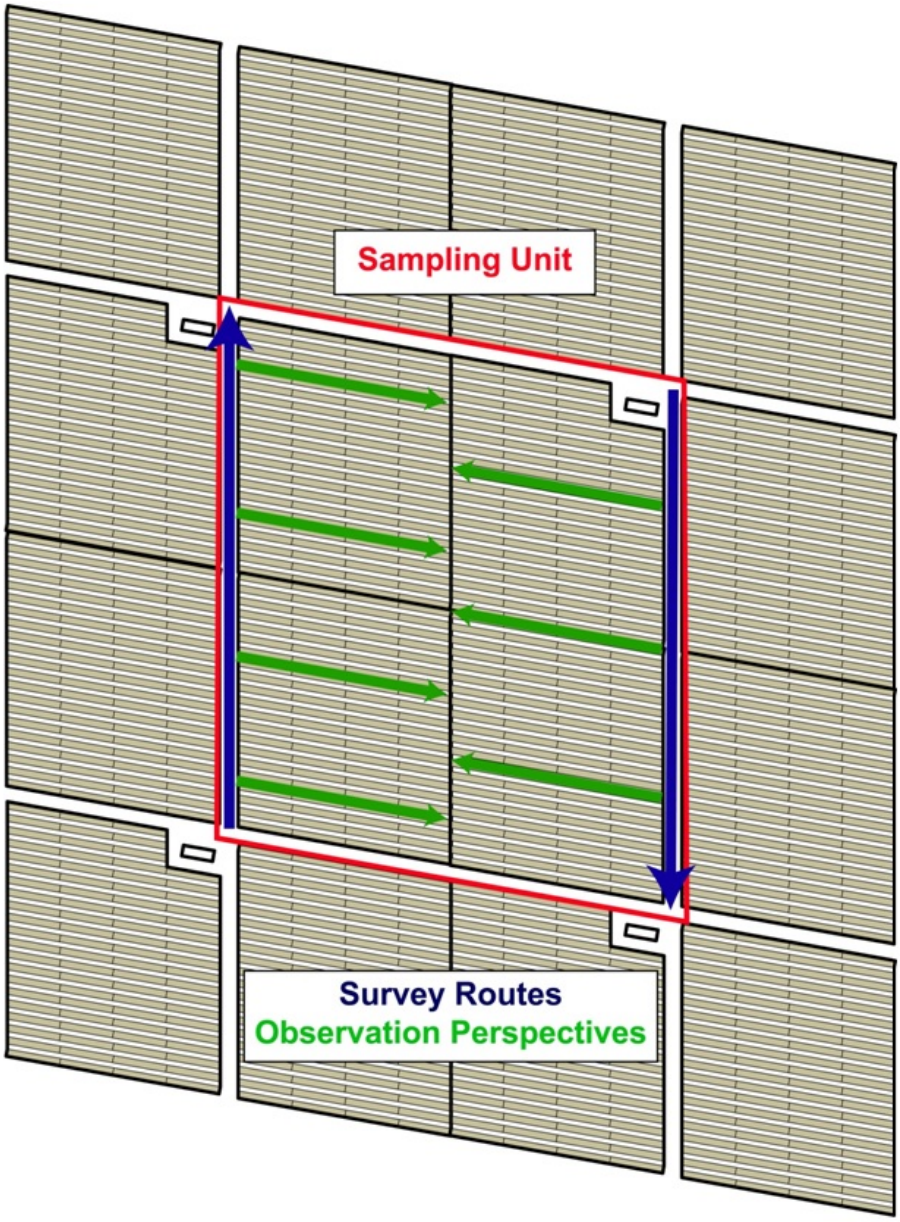


Figure 5. Illustration of a typical sampling unit and perimeter survey with travel routes and search areas ('observation perspectives').

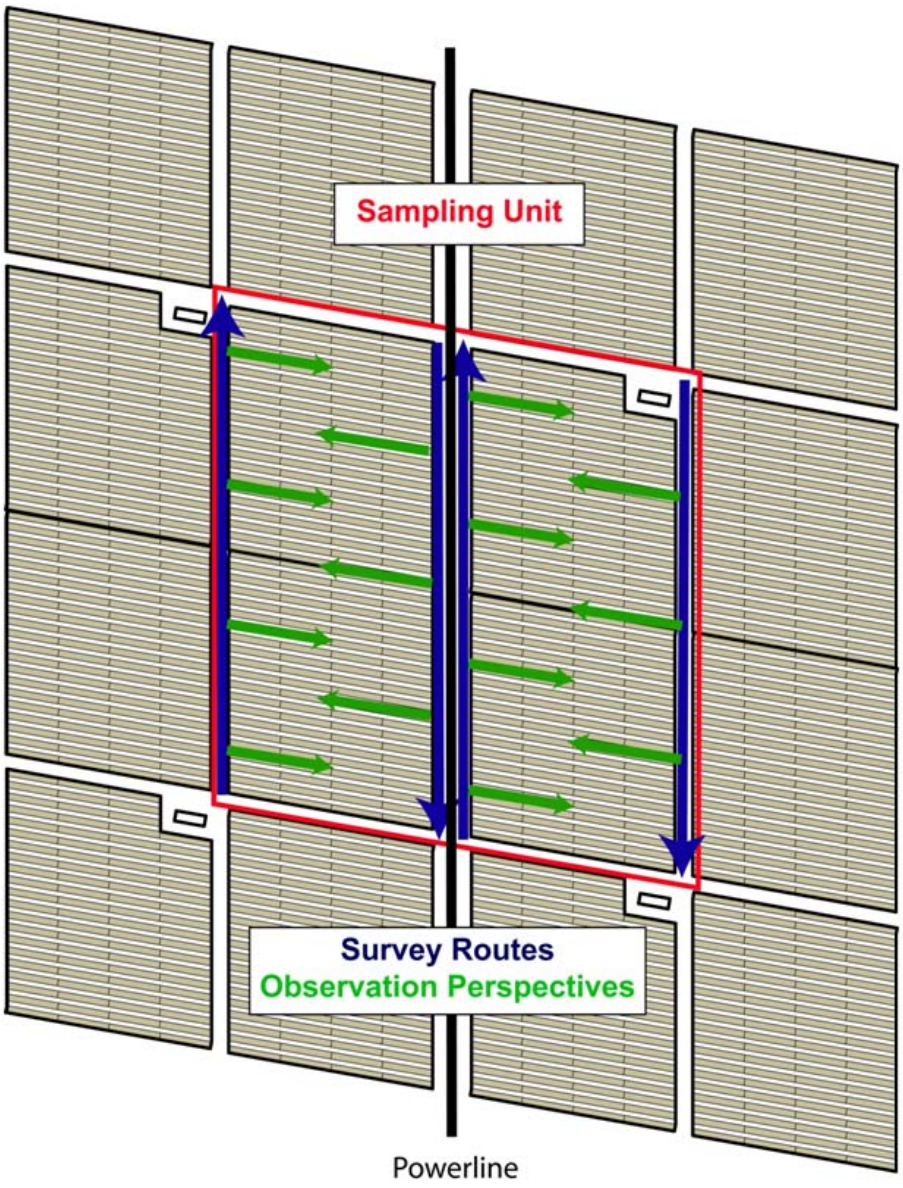

Figure 6. Illustration of a sampling unit survey including a distribution powerline with travel routes and search areas ('observation perspectives').

The perimeter-only survey design reflects two concerns: 1) minimizing movement between rows of solar panels. Because the area between electrified panel rows is an area of elevated risk, best practices dictate that personnel do not enter elevated risk zones unnecessarily; and 2) achieving an effective balance between logistic efficiency and sampling rigor given the constraints of transect spacing due to the width of panel rows. In support of the latter objective, a field trial was conducted to evaluate the ability of observers to detect carcasses of different types and sizes based on perimeter-only surveys that did not require walking between the rows of panels (H.T. Harvey and Associates 2013c). The field-trial surveys involved walking along the north-south edges of array sections perpendicular to the rows of panels and using naked-eye and binocular-aided scanning to search for placed carcasses of five non-native bird species, ranging in size from small house sparrows (*Passer domesticus*) to large ring-necked pheasants (*Phasianus colchicus*).

The field trial confirmed that, given the relatively flat, sandy, and uncluttered substrate that characterizes most of this solar facility, relatively large carcasses, such as rock pigeons (*Columba livia*) and pheasants, can be reliably detected using perimeter-only surveys, even when the continuous span of the solar-panel rows is 140 m, which applies across most of the facility. For smaller carcasses up to the size of small quail (*Coturnix japonica* in this case), however, detection probabilities will be much more strongly a function of distance. Distance sampling is well-equipped to estimate population sizes, even when the detection function indicates a rapid decay in detectability with distance (Buckland et al. 1993).

Not being able to detect most small to many medium-sized carcasses over a substantial portion of the solar facility would comprise a problematic bias if the probability of carcass occurrence was non-random within arrays (i.e., within sample units). In other words, the bias would create a problem for achieving representative sampling if the probability of mortality due to panel collisions varied in some predictable fashion relative to the distance from array edges, or if there was a tendency for fatalities to be clustered in the interior of the panel areas. Whether or not such conditions may apply to this facility is currently unknown; however, initial post-construction monitoring at another large photovoltaic solar facility in central California has not demonstrated any particular spatial bias in the distribution of fatalities documented there (H.T. Harvey and Associates 2014).

On this basis, fatality sampling will proceed using distance-sampling survey techniques and analytical methods, which include estimating and accounting for distance-related variation in the probability of detection based on the carcass data and bias trial data. In addition, searcher-efficiency trials that are tailored to include evaluating the influence of distance on the probability of detection will be conducted to assess and adjust for the possibility of a spatial bias in the distribution of fatalities. This can be accomplished by comparing the detection function derived from independent searcher-efficiency trials with the detection function derived from the actual fatality data (as it is calculated based on standard distance-sampling techniques). If the two independently derived functions suggest divergent relationships between distance and the probability of detection, the pattern of divergence between them can be used to adjust results of the distance-sampling-based fatality estimate. Depending on the detectability curve results,

methods for follow-up studies may be needed to corrected for this potential source of bias as determined by BLM and the ~~w~~Wildlife agencies.

4.2.4 Temporal Sampling Design

The appropriate frequency of fatality surveys depends on the species of interest and average carcass persistence times (Smallwood 2007, Strickland et al. 2011, USFWS 2012). Large raptors tend to persist and remain detectable for extended periods (weeks to months) due to low scavenging rates and relatively slow decay rates. If only large species were of interest, extended search intervals of 30–45 days might be appropriate; however, smaller birds and bats typically disappear at much faster rates, so shorter search intervals are required to ensure effective documentation of fatality rates among these species.

~~Publically accessible data from three wind-energy studies in the nearby Mojave Desert region of California and western Arizona provide additional, relevant insight (Chatfield et al. 2009, 2010; Thompson and Bay 2012). These studies recorded average persistence times of 17.5–46.8 days for large birds (average 29.0 days, median 22.6 days) and from 5.6–17.4 days (average 9.9 days, median 6.5 days) for small birds.~~ If the ~~average~~ median carcass-persistence time for small and medium birds and bats on the Project site ~~ranks~~ is low ~~toward the low end of values from these studies, which is typical for a broad range of other studies,~~ a 7-day search interval may be required to effectively document fatality rates for small birds and bats. If, however, median small-bird and bat carcass-persistence rates are ~~closer to or exceed the average value from these studies~~greater than 7 days, then a longer search interval may be more appropriate. The initial indications of rapid scavenging by ravens at the Project site suggested that a shorter search interval may be needed to provide precise fatality estimates for small bird and bat carcasses., ~~but L~~later data from Corvus (2014) suggests that ~~in spite of~~there is a period of rapid initial removal, particularly for small and medium carcasses with 50% of carcasses in these size classes removed in 8 and 5 days, respectively. Overall, mean carcass persistence in May and June was greater than 10 days for any size of carcass, and greater than 24 days for large carcasses.

Based on these considerations and preliminary data, and based on the simulation analyses discussed previously, the search interval for fatality monitoring will be variable depending on season (Table 2). Searches will be conducted every 7 days during spring and fall migration (~~March~~ February 15 – May 31, and ~~September~~ August 1 – ~~October 31~~November 15), and every 21 days during summer and winter (June 1 to ~~August~~ July 31, and November 16 to February ~~28/29~~14). After the first 6 months of fatality monitoring and concurrent carcass-removal trials (see below) have been conducted, the search interval may be adjusted based on estimates of carcass persistence. Using this seasonal approach will introduce a bias toward those species that migrate during the windows with more frequent monitoring. Migration is staggered and not all species migrate at the same time. Consequently, species that migrate outside of these designated periods may be underrepresented in the samples. In addition, Fall migration is typically longer than Spring ~~M~~migration with individuals at different life history stages migrating at different times. The data should be evaluated for potential bias resulting from differing migratory periods among species.

Adjusting fatality counts for carcass removal works best when the search interval remains constant through time (Huso 2010); however, within survey periods, season-specific estimates of carcass persistence can be calculated and incorporated in the overall estimation process when variable search intervals are used in different seasons (Shoenfeld 2004; Huso 2010, 2012; and other estimators all have facility to accommodate season-specific estimates). In addition, survey schedules will ensure that fatality surveys are evenly spaced in time to maximize detection of potential, unusual fatality events (Strickland et al. 2011). ~~For these reasons, a standard schedule for completing the surveys will be developed and followed, such that some surveys occur on each day of the standard work week and all sampling units are surveyed on a regular schedule, as dictated by the season.~~

4.2.5 Survey and Data Collection Protocols

Fatality surveys will be conducted ~~on foot or by vehicle,~~ with the observers striving for a consistent pace/speed and approach, and a uniform search effort throughout the search. Searchers will use binoculars at their discretion to survey for carcasses between each row of panels. ~~Surveyors will never be far from a vehicle and will be encouraged to take breaks. Additionally, t~~The Project has rigorous safety protocols in place that address heat and other safety issues. When a potential carcass is detected, the observer will immediately proceed down the row to confirm the detection and, if valid, fully document and bag it according to standard protocols (see below). Depending on the size and nature of the carcass, the observer will either immediately collect the carcass (smaller, easily collected and transported packages) or flag it for pick-up once the sampling-unit survey is completed (larger, messier, or otherwise complicated collections) or to identify it to species. All carcasses will be stored in freezers on-site until the BLM and FWS determine the ultimate disposition.

All bird and bat injuries and fatalities discovered during, or incidental to, the standard carcass surveys will be documented according to the requirements and standards reflected in the USFWS Avian Injury and Mortality Reporting Form. The form is a reporting requirement of the USFWS Special Utility (SPUT) Permit issued to the Project to authorize the handling of dead or injured birds. In addition, finds will be classified as a fatality according to standards commonly applied in California (Altamont Pass Monitoring Team 2007, CEC and CDFG 2007), which dictate that when only feathers are found, to be classified as a fatality, each find must include a feather spot of at least five tail feathers or two primaries within 5 m (16.4 ft) or less of each other, or a total of 10 feathers. Searchers will make their best attempt to classify feather spots by size according to the sizes or identifying features of the feathers. A separate fatality estimate will be made for feather spots for which size classification is impossible. Digital photographs will be taken to document all incidents, and when possible, plausible cause of death will be indicated on data sheets based on evidence (such as blood or fecal smears on solar panels, burns that may indicate electrocution~~,~~ or blunt trauma that may indicate collisions). All carcasses will be examined and where possible cause of death will be recorded (e.g. burns may indicate electrocution, and blunt trauma may indicate collisions). The Authorized Avian Biologist will make any decisions on questionable finds.

All fatalities will be assigned to a size class, a taxonomic family, and an ecological guild according to ~~Appendix A~~weight categories (e.g., 0-100 grams; 101-999 grams; and 1000+ grams). ~~Carcasses from species that are nonresident and are night-migrants will be considered night-time fatalities; and those that are nonresident and day-migrants will be considered day-time fatalities. Residents and species known to migrate both at night and during the day will be classified as uncertain with respect to likely time of death.~~ Species will also be classified as resident, overwintering, or whether they are diurnal or nocturnal migrants (or both). It is necessary to know size classes to appropriately correct for searcher efficiency and scavenging, and information about taxonomic family, ecological guild, and time of day when active are relevant to the specific USFWS and project goals of the monitoring plan.

To ensure accurate ~~delineation~~ documentation of the fatality locations, the observer will record the array number, Global Positioning System (GPS) coordinates in latitude/longitude ~~at the site of the fatality~~of the carcass location~~,~~ using a handheld device accurate to ± 3 to 4 m (9.8 to 13.1 ft), and a measurement of the distance from the fatality location to the end of the panel row from which the carcass was detected. When an observer proceeds down panel rows to confirm and document detected fatalities, they may detect other fatalities that they did not observe based on the perimeter-only survey. Because it is not known how the initial detection of a carcass in a row may affect subsequent detections in the same row, all fatalities located during surveys should be included in the analysis. ~~Including such detections in the fatality estimate will confound estimation of fatality density based on application of standard distance-sampling analytical methodology. Therefore, all such supplementary detections will be classified as "incidental" finds (discussed further below) and will be excluded from calculation of adjusted fatality estimates.~~

Data records for each survey will also include: 1) full first and last names of all relevant surveyors in case of future questions; 2) start and stop times for each individual sampling-unit survey; 3) a description of the weather conditions during each search; 4) a standardized description of the current habitat and visibility classes represented within each sampling unit; and 5) a description of any search-area access issues, if relevant. Data collected will also include all appropriate fields contained in the SPUT permit.

All personnel involved in implementing this Plan will be ~~covered~~ included as sub-permittees under the Project's USFWS SPUT Permit, issued either to the Project or a consultant authorized by the Project. If the CDFW does not consider coverage under the USFWS SPUT permit sufficient, all personnel implementing this plan will also be covered under any applicable CDFW Scientific Collecting Permit if provided and issued either to the Project or its consultant. Ideally, the relevant state and federal permits will allow fatalities discovered during the study to be removed from the field, stored on-site in a freezer, and used in searcher-efficiency and carcass-removal bias trials. Necessary exceptions will apply to all special-status species (see below). Otherwise, surveyors will place all discovered carcasses or body parts that are not of a special-status species and are not part of an ongoing bias trial in zip-locked plastic bags, clearly label each bag with the incident number, and deliver the bags for storage in the designated freezer at the Project facility.

4.2.6 Fence Line Monitoring

The perimeter fence is subject to inspections approximately once every 7 days during spring and fall migration, and approximately once every 21 days during winter and summer periods with intervals adjusted as necessary based on the carcass persistence trials to be consistent with search intervals at other project features. A searcher will drive the entire inner perimeter of the fence, scanning for fatalities within an approximate 6-m strip transect centered on the fence. Travel speed will be no greater than 5 miles per hour (8 kilometers per hour) while searching to ensure quality detection, and safety. Personnel conducting fence checks will document bird and bat injuries and fatalities discovered along the inner fence line. Injuries and fatalities along the fence line will be documented in the same manner as used for those discovered during the array carcass surveys, and will be reported to the USFWS and CDFW as part of the same overall reporting process. Searcher efficiency trials will be conducted along the inside of the fence in a similar fashion to the trials at the solar arrays. Carcass removal trials conducted at solar arrays will include areas near the inside of the fence as well.

4.2.7 Power Line Monitoring

Power lines are built to APLIC (2005, 2006, 2012) guidelines; ~~as such fatality due to power lines is considered to have been minimized~~however, there is still a collision risk for many bird species. ~~However~~Consequently, a 50% sample of the Gen-tie Line will be monitored every ~~seven~~ 7 days during spring and fall migration and approximately every 21 days during summer and winter with intervals adjusted as necessary based on the carcass persistence trials to be consistent with search intervals at other project features. Searchers will drive or walk 50% of the Gen-tie Line during each visit, scanning for birds within 15 m from the line. Injuries and fatalities along the Gen-tie Line will be documented in the same manner as used for those discovered during the array carcass surveys, and will be reported to the USFWS and CDFW as part of the same overall reporting process.

Some overhead electrical feeder and distribution power lines are co-located within the solar arrays and these co-located power lines may be searched as part of the regular monitoring schedule at arrays. Fatalities that are determined to have been caused by the power lines (as determined by the nature of injuries) will be reported as such to the USFWS and CDFW as part of the same overall reporting process and included in fatality estimates~~, but excluded from adjusted fatality estimates attributed to PV arrays~~. In addition, portions of the Gen-tie Line are co-located with third-party structures and facilities, including other transmission infrastructure and roadways and, therefore, the source of a particular fatality may not be attributable to the Project's facilities.

4.2.8 Clearance Surveys

Depending on when fatality surveys commence, a one-time clearance survey will be conducted beginning approximately 21 days before the first round of official surveys begins in all areas planned for survey (fence line~~fenceline~~, gen-tie sample areas and solar arrays). The purpose of this survey will be to clear the survey area of any accumulated carcasses that may be present. The sequence of clearance surveys will mirror the schedule for the first official survey to ensure

that the interval between the clearance survey and the first standard survey is the same for all sampling units. This is necessary to ensure that carcasses detected during the first round of surveys represent only fatalities that occurred during a preceding interval equivalent to the search interval that will apply afterward. Carcasses that are missed during the clearance survey will cause an upward (conservative) bias in the fatality estimate. Additionally, some estimators (such as the Huso estimator described above) become biased if carcasses that are not detected during a trial are still available during subsequent trials. ~~This 'bleed-through' effect can be ameliorated by including only fresh carcasses in the fatality estimate, where 'fresh' means a carcass that has arrived since the previous search. Carcasses that cannot reliably be aged (probably most carcasses) will be assumed to be fresh; this will cause an upward (conservative) bias in the fatality estimate.~~

Comment [FWS MB-TD6]: The carcass aging process is not well defined and may vary seasonally. Appropriate caveats can be included in the reporting, but all carcasses found during surveys should be used.

4.3 Bird Rescue

Surveyors will record any injured or rescued birds or bats located during surveys. Birds will be assessed by a qualified biologist to determine if it is appropriate to transport the individual to the nearest permitted rehabilitation facility for proper care, or to release them. Injured raptors will be handled only by experienced personnel and will be taken only to rehabilitation facilities that are permitted to handle raptors; this provision is particularly important for eagles. From the Project site, the closest rehabilitation facilities capable of handling all avian species are:

- Coachella Valley Wild Bird Center, 46500 Van Buren, Indio, California, 92201; Phone: 760-347-2647; Contact: Linda York, Executive Director; Hours of Operation: 9:00am-12:00pm, 7 days a week. http://coachellavalleywildbirdcenter.org/
- The Living Desert Zoo & Gardens, 47900 Portola Avenue, Palm Desert, California, 92260; Phone: 760-346-5694 x8 x1; Contact: Sheila Lindquist, North American Manager; Hours of operation: 8:00am-1:30pm (June-September), 9:00am-5:00pm (October-May), 7 days a week (closed Christmas Day). http://www.livingdesert.org/animals/wildlife-rehabilitation/
- Hope Wildlife Rescue, 18950 Consul Avenue, Corona, CA 92881; Phone: 951-279-3232; Contact: Bill Anderson or Cyndi Floreno; **must call first (this is a CA-licensed rehabilitator working out of a personal residence)**.
- All God's Creatures Wildlife Rescue & Rehabilitation, Chino Hills, CA; Phone: 909-393-1590; Contact: Lori Bayour; http://www.allgodscreatures.net/index.html; no address available, contact by phone.
- International Bird Rescue, Los Angeles Center, San Pedro, CA, 90731; Phone: 310-514-2573; Hours: 8:00 am - 5:00 pm.
- A list of wildlife rehabilitators maintained by California Department of Fish and Wildlife: http://www.dfg.ca.gov/wildlife/WIL/rehab/facilities.html
- The California Council for Wildlife Rehabilitators: http://www.ccwr.org/resources/rehabilitation-facilities-region-6.html

If stranded, but apparently uninjured, water-associated birds are discovered at any time during surveys, the surveyor will take immediate steps to notify an on-call biologist, and assist with efforts to secure the bird and have it transferred as expediently as possible to Lake Tamarisk for release into the water ~~there~~. Injured water-associated birds may be taken to International Bird Rescue, which specializes in the care and rehabilitation of water-associated birds. If a mass event involving many such birds is observed, the surveyor will immediately notify on-call biologist or other biological personnel working on the site about the details and request their assistance identifying injured versus non-injured birds and transporting injured birds to the nearest rehabilitation facility. International Bird Rescue can also assist with mass stranding events. Rehabilitation facilities should be compensated for the costs associated with each bird put under their care.

If a surveyor discovers a dead individual of a species that is fully protected by the state or federally or state-listed as threatened or endangered, and for which handling is not specifically authorized under the applicable salvage permits, he/she will collect data and photos as for any other fatality, but then flag the carcass to mark its location and leave it in place. If it is a federally listed species under the Endangered Species Act, the surveyor will ~~within 24 hours call~~immediately call a USFWS Office of Law Enforcement special agent to determine the appropriate follow-up action.

4.4 Searcher Efficiency Trials

Estimating searcher-efficiency (distance-related detection functions) is a standard component of the distance-sampling approach. Moreover, because estimating detection functions is applied to all survey data and can be organized to variably adjust in relation to covariates of interest (e.g., season, habitat, and carcass size classes), application of this approach will account for typical factors of interest for fatality studies (CEC and CDFG 2007, Huso 2010, Korner-Nievergelt et al. 2011, USFWS 2012, Smallwood 2013). In this case, independent searcher-efficiency trials per biologist, per season, will be conducted to help assess and adjust for potential spatial bias in the distribution of fatalities among arrays. Separate trials will be conducted to assess detection probability associated with fence and gen-tie line searches.

~~The desert landscape in which this Project is located generally changes little with the seasons, save for brief periods following winter and spring rains when floods may occur and blooming plants may flourish. Therefore, the need to repeat searcher efficiency trials to evaluate the effects of seasonal habitat change will be limited. A recent meta-analysis involving data from more than 70 wind energy projects suggested that including habitat visibility class as a predictive variable generally eliminated any otherwise apparent seasonal effects on searcher efficiency (Smallwood 2013). Nevertheless,~~ ~~the~~ Ssupplementary searcher efficiency trials for this Project will be repeated ~~quarterly~~ seasonally (winter, spring, summer, and fall) and trials will be organized so that all search personnel participate in bias trials. Placement of trial specimens will be timed to limit the number of trial carcasses placed on the landscape at any one time (minimizing the chance of artificially attracting scavengers or, conversely, scavenger swamping; Smallwood 2007). This approach will also ensure that any new surveyors that join the crew participate in searcher efficiency trials. The trials will also be managed to ensure effective

quantification of searcher efficiency in relation to predefined habitat visibility classes (low, medium, and high, if relevant), size classes of birds (small and large), and detection distance.

The bias-trial sample sizes required to produce precise, adjusted fatality estimates are not well established, in part because needs may vary substantially depending on actual project-specific searcher efficiency, carcass removal, and fatality rates. To ensure reasonable mathematical integrity and statistical power, the software package developed by Huso et al. (2012) for estimating wind-energy-related fatalities requires a minimum of 10 bias-trial samples for each covariate-group analyzed. If there was no substantive variation in habitat/substrate cover within the Solar Farm, this requirement would translate a minimum need to place at least 10 small and 10 large birds as test specimens during each seasonal period. However, using searcher-efficiency trials to help evaluate the efficacy of perimeter-only surveys and the distance-sampling approach used in this investigation will require larger sample sizes to produce a sampling design that effectively accounts for distance as a key covariate of interest. In addition, if growth of new ruderal vegetation, or substrate heterogeneity caused by flood events, is sufficient to create a new visibility class under the arrays, the specimen numbers would need to increase to effectively account for this factor. It will also be necessary to ensure that the estimates of searcher efficiency encompass variation among multiple surveyors. ~~The influence of individual surveyors will not be accounted for in a formal, statistical sense by including "surveyor" as a covariate in the estimation model; however, all surveyors will be tested similarly.~~ Each surveyor will be exposed to multiple test specimens of each size class, and at similar repeated levels if testing in different habitat visibility classes is required. A minimum of 20 carcass samples per size class is anticipated within the fence line~~, solar array,~~ and gen-tie sampling areas per season. Within solar arrays, a sufficient number of carcasses shall be placed across the potential range of distances being searched to allow calculation of a robust searcher efficiency detection function for each observer across the entire distance.

Comment [FWS MB-TD7]: Do searcher efficiency trials need to be conducted in an arena with adequate trial samples at each distance? Even if done in survey plots there needs to be adequate trial samples at each distance.

Comment [USFWS 8]: How will these few samples 'test' the observers?

Jody, did we settle on a number for searcher efficiency trials?

Besides representing birds of different sizes, another important factor to consider in searcher-efficiency and carcass-removal trials is the bird species to use as trial specimens. Ideally, all carcasses used for both searcher-efficiency and carcass-removal trials should reflect the range of species likely to be encountered as fatalities in the Project area (CEC and CDFG 2007). Because obtaining sufficient samples of "natural" carcasses often is difficult, researchers frequently resort to using readily available, non-native surrogate species in bias trails; however, this practice may result in biased results when compared to studies that use only "natural" specimens (Smallwood 2007). For all bias trials, this program will maximize use of representative native or naturalized species authorized by permits, either found during the study or gathered elsewhere, as needed, and from diverse sources where possible, but all trial carcasses will be obtained and deployed in a manner that are consistent with applicable regulatory requirements.

Another factor that influences carcass detectability is how fresh and intact the carcass is (Smallwood 2007, 2013). If multiple pieces of a depredated or scavenged carcass are scattered over a modest area, in some cases the fatality may be more easily detected; however, detectability generally decreases when only remnants of a carcass are present, or when the

carcass is aged and degraded. Nevertheless, in contrast to wind-energy projects, there is little expectation that this Project will cause injuries and fatalities that result in dismembered carcasses, so this factor is not expected to influence searcher-efficiency or carcass-removal rates (Smallwood 2013). Therefore, bias trials conducted in this study will involve primarily intact carcasses. The searcher-efficiency trial specimens may range from freshly thawed to partially decayed (i.e., selected, subject to availability, to mimic the range of carcass decay that typically accrues over 7-day periods).

A field supervisor or other technician not involved in the standard surveys will place the trial specimens and will recover any specimens missed by the surveyors. All trial specimens will be placed according to a sampling plan that randomly allocates carcasses of different sizes among survey plots and survey days within the assessment areas, but is stratified to ensure equitable representation of different surveyors, fence line vs. solar arrays vs. gen-tie and seasons. To minimize the possibility of unnecessarily attracting scavengers or, conversely, contributing to scavenger swamping, which could affect ongoing carcass-removal trials (Smallwood 2007, Smallwood et al. 2010), placement of searcher-efficiency trial specimens will ~~occur sporadically~~be distributed throughout the ~~first~~ year (appropriately organized to provide season-specific estimates with adequate samples per surveyor/per season to provide a robust estimate of searcher efficiency~~, if required~~), with few specimens placed at any one time. Carcasses will be placed carefully to minimize disturbance of substrates that may bias carcass detection.

All trial specimens will be inconspicuously marked with a piece of black electrical tape wrapped around one leg, in a manner that allows the surveyor to readily distinguish trial specimens from new fatalities, but without rendering the specimen unnaturally conspicuous (Smallwood 2007, USFWS 2012). To ensure a degree of "natural" placement, carcasses need to be represented by placing between rows of panels, under panels, near i-beams supporting the panels, or in the open. Therefore, carcasses will be tossed towards the designated, randomly chosen placement spot from a distance of ~~one~~ 3 to ~~two~~ 6 m. Documentation of each location will include GPS coordinates, notes about the substrate and carcass placement, and a digital photo of the placement location.

Surveyors will have only one opportunity to discover placed specimens. Any missed specimens will be recovered as quickly as possible after surveys have been completed in a given area, and after the surveyor(s) have become aware of the trial through discovery of one or more specimens. Some researchers have argued for leaving missed specimens in place to enable possible discovery in a subsequent survey and thereby mimic the natural situation in which "bleed-through" is possible (e.g., Smallwood 2013, Warren-Hicks et al. 2013; discussed further below). Although this approach may have merit in some situations, its potential value for this Project is offset by the need to avoid attracting ravens, which represent a threat to desert tortoises living in the area (Ironwood Consulting 2010b).

4.5 Carcass Persistence Trials

The degree to which carcasses persist on the landscape depends on a variety of factors reflecting seasonal variation in landscape/climatic conditions and the scavenger community.

The composition and activity patterns of the scavenger community often vary seasonally as birds migrate, new juvenile birds and mammals join the local population, and mammalian scavengers variably hibernate or estivate. Seasonally variable climatic conditions also may contribute to variation in carcass decay and removal rates due to variation in temperatures, solar insolation, wind patterns, and the frequency of flooding events. Therefore, to ensure accurate treatment of this bias factor, carcass-persistence rates will be assessed on a quarterly or at least semi-annual basis during the first year that fatality surveys are conducted (CEC and CDFG 2007, USFWS 2012, Smallwood 2013), and during the second year as needed. It is also imperative that carcass-persistence trials effectively account for the influence of carcass type/size, given that persistence times may vary widely depending on the species and size class involved (Smallwood 2013).

To quantify carcass persistence, a minimum of ~~10 small and 10 large birds~~20 small, 20 medium, and 10 large carcasses for each survey area (i.e., a total of 50 carcasses within each area for a total of 150 carcasses for each persistence trial) ~~-~~will be randomly placed and monitored within the solar arrays, along the fence line, and along 50% of the Gen-tie Line each season. A minimum of ½ of the carcasses will be monitored, using motion-triggered, digital trail cameras (e.g., see Smallwood et al. 2010) while the remaining will be visited on foot, for 30 days or until the carcass has deteriorated to a point where it would no longer qualify as a documentable fatality. For carcasses not set up with cameras, the carcass will be visited once a day for the first 4 days, and then every 3 to 5 days until 30 days is reached. Fake cameras or cameras without bias trial carcasses will also be placed to avoid training ravens to recognize cameras as "feeding stations". Periodic ground-based checking of carcasses also will occur to guard against misleading indicators of carcass removal, such as wind blowing the carcass out of the camera's field of view. To minimize potential bias caused by scavenger swamping (Smallwood 2007, Smallwood et al. 2010), carcass-persistence specimens will be distributed across the entire Solar Farm, not just in areas subject to standard surveys, and new specimens will be placed every two to three weeks in small numbers.

Trial specimens will include only intact, fresh (i.e., estimated to be no more than one or two days old and not noticeably desiccated) bird carcasses that are either discovered during the study or are acquired from other sources after having been frozen immediately following death. If permits allow, specimens used will be strictly limited to species known to occur in the area or that are substantially similar to such species. Surrogates, such as game birds and domestic waterfowl, will not be used unless required by permit restrictions, because scavenging rates for surrogates may be artificially high (Smallwood 2007, 2013).

To reduce possible biases related to leaving scent traces or visual cues that may unnecessarily alert potential scavengers, all carcasses used in carcass-persistence trials will be handled with latex gloves, and handling time will be minimized. All trial specimens will be inconspicuously marked with a small piece of green electrical tape wrapped around a leg to distinguish them from both unmarked fatalities and searcher-efficiency trial specimens.

Upon conclusion of the relevant monitoring period, each trial specimen will be classified into one of the following categories:

Intact: Whole and unscavenged other than by insects

Scavenged/depredated: Carcass present but incomplete, dismembered, or flesh removed

Feather spot: Carcass scavenged and removed, but sufficient feathers remain to qualify as a fatality, as defined above

Removed: Not enough remains to be considered a fatality during standard surveys, as defined above

4.6 Estimating Adjusted Fatality Rates

The sampling design will enable calculation of fatality estimates adjusted for searcher-efficiency, carcass-removal rates, and proportion of area sampled. The adjustment for searcher efficiency will occur by virtue of applying standard methods for analyzing detection data collected using distance-sampling methods, with the data partitioned by season and standardized carcass size classes. The probability of detecting rare events, such as a Yuma Ridgeway's (~~Yuma~~ formerly Clapper) Rail mortality should be calculated using the Evidence of Absence approach (Dalthorp et al 2014.

Formatted: Space Before: 12 pt

The fatality estimates will be adjusted for variation in carcass persistence, by applying seasonal and carcass-size-specific correction factors to the fatality estimates that have been adjusted for distance-related variation in the probability of detection.

The analytical approach used to calculate adjusted fatality estimates will be similar to that applied in cases where the fatality estimates are derived from strip transects. ~~It is instructive to briefly review the history of methodologies applied in the context of renewable-energy studies, primarily at wind energy facilities, relevant insights about important factors to consider, and example formulations that will be applicable. It is also important to recognize that developing methods for conducting fatality surveys and associated bias trials, and for deriving accurate, adjusted, facility-wide fatality estimates is an actively evolving science. Accordingly, the analytical methods ultimately applied in this investigation may evolve over time to ensure application of the most current, rigorous and scientifically sound methods.~~

Comment [FWS9]: Extraneous information for methodology document – More appropriately placed in the subsequent reports.

~~The recent history of estimating bird and bat fatalities at renewable-energy facilities involves use of primarily four estimators (Korner-Nievergelt et al. 2011, Smallwood 2013, Warren-Hicks et al. 2013). Erickson et al. (2000) and Johnson et al. (2000, 2003) first developed and used a "naïve" estimator, representing a straightforward adjustment of the raw fatality count for the probability of carcass persistence and probability of detection. Shoenfeld (2004) modified the "naïve" estimator by assuming a Poisson process for the occurrence of bird deaths and scavenger removal, with that modification applied by Kerns and Kerlinger (2004) and Erickson et al. (2004). The modified estimator proved to be biased low, however, after which Smallwood (2007) developed an estimator that incorporated an adjustment for periodic repetition of search events.~~

~~Yet in practice, periods between searches often are inconsistent, which violates a primary assumption of Smallwood's estimator. Huso (2010) then conducted simulations and conceptualized the logic behind development of a new estimator, based on Thompson (1992). Huso's estimator is more flexible than the Shoenfeld and Smallwood estimators because it allows for unequal probability sampling, accounting for potential differences in searchability among plots and variation in detectability due to carcass size or type of habitat. It also incorporates an "effective search interval," based on the mean carcass persistence time, which is defined as the length of time during which the probability of a carcass persisting is more than 1%. Based on simulations, Huso (2010) found that her estimator was consistently less biased than the Shoenfeld and Smallwood estimators. In addition, although the Shoenfeld estimator could perform similarly under certain conditions (e.g., when search intervals are relatively long [14–28 days] and mean carcass persistence time is relatively short [less than 16 days]), Arnett et al. (2009) found that it greatly underestimated fatality when search efficiency was low (e.g., 13% for some bats).~~

~~A potential problem with both the Huso and Shoenfeld estimators is that their formulations assume that a given carcass is available to be discovered by a surveyor only once (Huso 2010), or that it is detectable with the same probability until it is removed (Shoenfeld 2004). In other words, the estimators make unrealistic assumptions about the probability that a carcass can be discovered in a subsequent survey if it was missed during the first survey conducted after deposition on the landscape. The idea that a given carcass may persist through more than one survey period is called "bleed through" (Smallwood 2013, Warren-Hicks et al. 2013).~~

~~More recently, Korner-Nievergelt et al. (2011) developed a new estimator, based on an explicit process model built from the conceptual model originally developed by Baerwald and Barclay (2009), which allowed for detection of carcasses during repeated searches, and accommodated decreasing searcher efficiency in repeated searches due to factors such as carcass decay. Based on simulations, they found that the Shoenfeld (2004) estimator generally underestimated fatalities unless carcass persistence time was long. They found that the naïve (Johnson et al. 2003) and Huso (2010) estimators overestimated fatalities when searcher efficiency was constant (and low for the Huso estimator), the search interval was short (1-, 7-, and 14-day intervals were analyzed), and average persistence time was long (30 days), but both estimators performed well when searcher efficiency decreased over time. The Korner-Nievergelt estimator appeared unbiased under all simulated scenarios where searcher efficiency and the probability of carcass removal remained constant over time, but it underestimated fatalities when searcher efficiency decreased over time. The Huso estimator proved robust when searcher efficiency and the probability of carcass removal decreased over time, whereas the Korner-Nievergelt estimator appeared robust to decreasing removal probability, but underestimated fatalities when searcher efficiency decreased over time and the search interval was short. All of the compared estimators were similarly biased low when the probability of carcass removal was high and increased through time. In the end, Korner-Nievergelt et al. (2011) concluded that no single estimator consistently outperformed the others and was likely to work optimally in all study situations. For this reason, the estimator (or estimators) selected will depend on the conditions~~

~~measured at the site and monitoring needs, including comparisons with previous studies and inclusion in meta-analyses.~~

~~Analogs of both the Huso and Korner-Nievergelt estimators should perform well for the Project. Korner-Nievergelt et al. (2011) touted stated that their new estimator as is adaptable to different situations, because it was is based on an explicit process model; however, the Huso (2010) estimator and related software (Huso et al. 2012; developed for wind-energy assessments but easily adaptable to solar-energy investigations) incorporates additional parameterization to model the influence on searcher efficiency and carcass removal of covariates, such as season, carcass type/size, and habitat visibility classes.~~

For illustrative purposes, we summarize here the basic formulation of the Huso estimator, the first part of which pertains to fatality estimation for different strata, or groups. Essentially, the smallest group for which fatalities are estimated can be considered a stratum, with stratum *k* representing, for example, a set of similarly sized birds within a defined habitat visibility class. Note that strata should be defined to ensure minimum variance in detection probabilities within individual strata, whereas probabilities may vary considerably among strata (e.g., for small versus large birds, or in habitats of low versus high visibility). Depending on the circumstances, there can be strata based on species groups, size classes, seasons, habitats, and/or infrastructure types (also could conceivably model distance categories as another covariate).

For a particular stratum *k* for a given survey plot and search interval, fatality can be estimated as:

$$\hat{F}_k = \frac{c_k}{g_k},$$

where c_k is the number of observed carcasses and g_k is the probability of detecting a carcass. The detection probability *g* typically is the product of three variables: the probability of a carcass persisting (*r*), the probability of a carcass being observed given that it persists (*p*), and the effective proportion of the interval sampled (*v*):

$$\hat{g} = \hat{p} * \hat{r} * \hat{v}.$$

The probability of a carcass being observed given that it persists (i.e., searcher efficiency) is estimated as:

$$\hat{p} = \frac{number_observed}{number_available},$$

with data for calculating this metric derived from searcher-efficiency trials where known numbers of carcasses are distributed over the search area and carcass detection rates are quantified.

AR072924

The probability of a carcass persisting is estimated as:

$$\hat{r} = \frac{\bar{t}(1-e^{-I/\bar{t}})}{I},$$

where $\bar{t}$ is the estimated mean carcass persistence time and *I* is estimated as:

$$I = \min(I_a, \tilde{I}),$$

where I_a is the minimum actual time between searches and $\tilde{I}$ is the effective search interval, defined as:

$$\tilde{I} = -\log(0.01) \cdot \bar{t}.$$

The effective proportion of the interval sampled is estimated as:

$$\hat{v} = \min(1, \tilde{I} / I_a).$$

For this investigation, the formulation for calculating $\hat{F}_j$ would differ from that outlined above, in that "c_k" would represent the estimated number of fatalities already adjusted for searcher efficiency, based on application of distance-sampling methodology, and then g_k would represent the product of only the estimated carcass persistence (*r*) and the effective proportion of the interval sampled (*v*). With this modification, the rest of the formulation would be similar.

For a given plot in search interval *j*, the adjusted total number of fatalities is calculated as:

$$\hat{F}_j = \sum_{k=1}^{K} \hat{F}_{jk},$$

where $\hat{F}_{jk}$ is the estimated number of fatalities within stratum *k* of search interval *j*.

Finally, the estimate of Project-wide total fatalities during a given search interval is estimated as:

$$\hat{F} = \frac{1}{a} \times \left(\sum_{i=1}^{n} \frac{1}{\pi_i} \sum_{j=1}^{J} \hat{F}_{ij} \right),$$

where $\hat{F}_{ij}$ is the number of fatalities on plot *i* in search interval *j*, *a* is the proportion of area that was searched and π_i represents a modified weight associated with an unequal probability

sample (Huso 2010), and is the product of the probability of selecting plot *i* and the proportion of fatalities contained in plot *i*. The total number of search intervals is *J*, assuming that there is the same number of search intervals for each plot. In practice, one need not assume that *J* is constant, but presenting it this way simplifies the notation.

Adjusted fatality estimates for the Solar Farm will be expressed per unit area (e.g., acres ~~or~~ and arrays) per year.

4.7 Incidental Mortality Documentation

Once post-construction fatality monitoring begins, all subsequent bird and bat injuries and fatalities detected incidental to the standardized, post-construction monitoring program will be classified as "incidental finds," documented using similar procedures as are used for specimens discovered during the standardized surveys, and integrated with records from the standardized surveys for summary reporting and evaluation purposes. Incidental finds that occur outside of standard search areas will not be included in calculations of adjusted post-construction fatality estimates, but will be summarized within seasonal and annual reports (discussed below).

~~To ensure compatibility with the standardized fatality monitoring program, it will be essential that dead birds found in the standard search areas by other personnel be left in place, undisturbed, and not reported to the standard fatality surveyors at least until after the next scheduled search. Allowing incidentally detected carcasses to remain in place for one or more scheduled searches is consistent with the assumptions of distance sampling and the fatality estimators; failing to do so will degrade the precision of the estimates. For this reason, the locations of i~~Incidental finds located in standardized search areas will be ~~documented using location descriptions, specimen descriptions, and digital photographs, and will only be~~ reported directly to ~~the personnel responsible for overseeing the fatality monitoring program~~Authorized Biologist~~, without informing any of the standard fatality surveyors~~. These incidental finds will be documented using the same procedures as those discovered during standardized surveys. Data from incidental finds within standardized search areas will be included in analyses to estimate mortality within the solar arrays. Appropriate caveats can be included within the seasonal and annual reports to document the potential magnitude of any biases created by recovering these carcasses. ~~Incidental finds discovered in standard search areas can then serve to supplement the searcher efficiency trial specimens, and can be recovered later, as appropriate, by the monitoring team. Incidental finds within standard search areas that are discovered by searchers will be reported as normal. A summary of those that are not discovered by searchers will be reported, including whether they were recovered, and species identification. Incidental finds discovered outside the standard search areas can either be used as carcass removal trial specimens, if discovered fresh and permits allow, or recovered in short order by the fatality monitoring team per the usual practices for documenting and handling fatalities, outlined elsewhere in this Plan.~~

Comment [FWS10]: This is contrary to the raven mgmt. plan which requires that all carcasses be removed upon discovery to avoid conflicts with desert tortoises in adjacent habitats.

5.0 MINIMUM CREDENTIALS OF MONITORING PERSONNEL AND TRAINING

The mortality monitoring program will be overseen by an Authorized Avian Biologist approved by BLM and Wildlife agencies that has demonstrated the ability to accurately identify the species of birds and bats potentially impacted by the project. The Authorized Avian Biologist must be on-site during all monitoring periods to aid other staff in identifying effected species and cause of death.

Monitoring personnel may include solar facility staff. Monitors will be trained in distance-sampling search methodology, correct identification and documentation of carcasses, implementation of carcass removal trials and notification of a rehabilitation center in the event of injured birds or bats. Only staff/technicians that are listed under the SPUT permit will be allowed to handle carcasses. Accurate identification of rare, special status species will be emphasized during training. All surveyors will have photo cards to classify specimens and will take photographs of all finds. All data collection will be standardized and the Authorized Avian Biologist will decide which to report as survey observations; however, all observations that were not conclusive will be reported.

The curriculum and training materials for training of personnel in monitoring methods will be approved by BLM and the ~~W~~wildlife agencies ~~occur over a 2-day period~~ and will be conducted by ~~a qualified biologist~~The Authorized Avian Biologist prior to initiation of the study. Training materials may be augmented by wildlife agency input. Components of the training program will include:

- A classroom-based portion with lecture and handout materials, and photographic or specimen-based (if available) species identification;
- A field-based portion that allows trainees the opportunity to practice and receive feedback on conducting carcass searches and trials, identification of species, completing data forms, and following protocols for assessing and assisting injured birds and bats.
- Assessment of learning outcomes for each participant.
- A training log to be updated with each trainee's name and contact information upon successful completion of the course.

The ~~biologist~~ Authorized Avian Biologist that will conduct the training will, minimally, have a master's degree in biological sciences, zoology, botany, ecology, or a related field, and at least one year of field experience with avian or bat research or monitoring in the region. ~~A qualified~~The Authorized Avian ~~b~~Biologist will be on-site ~~call~~ to assist with species identification (e.g., via review of photographs ~~or onsite assistance if necessary~~) and other aspects of reporting. All reference material should be maintained and provided to the agencies in the event that there are questions about species identification.

6.0 REPORTING

6.1 USFWS Bird Fatality/Injury Reporting Program

The Project will report all documented bird injuries and fatalities to the USFWS using the required Avian Injury and Mortality Reporting Form that is a reporting requirement of the USFWS SPUT Permit issued to the Project to authorize the handling of dead or injured birds. SPUT reporting will be submitted monthly or in accordance with the terms of the permit. Similar reporting to the CDFW will be accomplished as a condition of any relevant Scientific Collecting Permit that the CDFW may issue to authorize the handling of dead or injured birds under state law.

6.2 Incidental Bird Injury/Fatality Reporting

All injury and fatality incidents discovered outside of the standardized~~standard~~ carcass surveys will be documented in the same manner as used for those discovered during the carcass surveys, and will be reported to the USFWS and CDFW as part of the ~~same overall reporting~~SPUT process. Special status or listed species will also be handled in a way that is consistent with project-specific SPUT permit conditions.

~~To ensure compatibility with the standardized fatality monitoring program, it will be essential that dead birds incidentally found by other personnel be left in place, undisturbed, and not reported to the standard fatality surveyors at least until after the next scheduled search. Allowing incidentally detected carcasses to remain in place for one or more scheduled searches is consistent with the assumptions of distance sampling and the fatality estimators; failing to do so will degrade the precision of the estimates. For this reason, the locations of incidental finds in standardized search areas will be documented using location descriptions, specimen descriptions, and digital photographs, and will only be reported directly to the personnel responsible for overseeing the fatality monitoring program, without informing any of the standard fatality surveyors. Incidental finds discovered in standard search areas can then serve to supplement the searcher-efficiency trial specimens, and can be recovered later, as appropriate, by the monitoring team. Incidental finds within standard search areas that are discovered by searchers will be reported as normal. A summary of those that are not discovered by searchers will be reported, including whether they were recovered, and species identification. Incidental finds discovered outside the standard search areas can either be used as carcass-removal trial specimens, if discovered fresh and permits allow, or recovered in short order by the fatality monitoring team per the usual practices for documenting and handling fatalities, outlined elsewhere in this Plan.~~ Additional details on reporting are found in the Desert Sunlight Wildlife Incident Reporting System (Appendix B).

6.3 Summary Reports

~~Quarterly~~ ~~monthly~~Seasonal electronic summaries of all biological monitoring activities will be submitted to BLM, USFWS, and CDFW throughout the ~~initial 2-year~~ monitoring period.~~.~~ After the fourth quarter of each year of monitoring, a biologist representing the Project will assist the

Project in preparing and submitting to the CDFW, BLM, and USFWS an annual report that summarizes dates, durations, and results of all fatality monitoring conducted to date.

~~A second comprehensive report will be prepared after the second full year of monitoring and submitted to the agencies.~~ To address the specific objectives of the monitoring plan, summary reports will include overall fatality estimates with confidence intervals, and fatality estimates by season. In addition, to the extent possible, fatality rates will be estimated and reported for likely diurnal, and likely nocturnal species, and for ecological guilds of interest (e.g., raptors, water-associated birds, passerines). Summary reports will also include spatial analyses of the data that address whether fatalities are randomly distributed throughout the facility. All raw field notes, field data, photographs, and GIS data will be submitted to the agencies.

7.0 TECHNICAL ADVISORY ~~GROUP~~ COMMITTEE AND ADAPTIVE MANAGEMENT

A Technical Advisory ~~Group~~ Committee (TAC~~G~~) will monitor Project activities, including fatality data, to provide recommendations to the BLM on the need for any adaptive management, including the adoption of avoidance and minimization measures ~~based on reported data~~and methods for assessing their effectiveness. The TAC~~G~~ will consist of ~~a single~~ resource specialists and project biologists from the BLM, USFWS, and CDFW. Persons with scientific expertise may be invited by TAC members if deemed appropriate. In addition, representatives from the Project and the consultants involved in the conduct of the studies will attend and participate in meetings. The TAC~~G~~ will provide advice and recommendations to the BLM Authorized Officer on developing and implementing effective measures to monitor, avoid, minimize, and mitigate impacts to wildlife species and their habitats related to operations. The BLM Authorized Officer will evaluate any recommendations of the TAC~~G~~, including discussions with Desert Sunlight concerning new measures or measures that are not completely detailed in this BBCS and requisite effectiveness monitoring, and make a decision on what measure(s) and monitoring to require for implementation.

A TAC~~G~~ Lead from the Project will be designated for the group whose duties will include disseminating Project data, including data on fatality events, setting up and moderating meetings, reviewing of fatality data, and documenting adaptive management recommendations for the Project. Because the Project occurs on BLM land and BLM is the federal decision-maker, BLM will provide a designated TAC~~G~~ Lead for the Project. It is the TAC~~G~~ Lead's responsibility to coordinate meetings and involve all team members.

The guiding principles, duties, and responsibilities of the TAC~~G~~ include the following.

- The TAC is only an advisory committee.
- Make recommendations based on best available science and existing approvals and permits to address specific issues resulting from the Project.

- Recommendations will generally be made by consensus. Where consensus cannot be reached, multiple recommendations will be put forth to the BLM, FWS, and CDFW management for a final ~~management~~ decision.
- ~~The TACG is only an advisory committee, and final management decisions will be made by the BLM Authorized Officer.~~
- Provide sufficient flexibility to adapt as more is learned about the Project as well as strategies to reduce avian impacts if warranted.
- Review results of fatality monitoring.
- In accordance with Mitigation Measure (MM) WIL-5 of the Project's Record of Decision (ROD), if BLM, FWS, and CDFW determine~~s~~, based on post-construction monitoring, that bird mortality caused by solar facilities is substantial and is having potentially adverse impacts on special-status bird populations, the TA~~G~~C may recommend adaptive management strategies such as installing additional bird flight diverters, alterations to project components that have been identified as key mortality features, or implementing other appropriate actions to address the relevant findings based on the data.
- Review annual report on status of compliance with mitigation measures and permit conditions and provide recommendations to the BLM Authorized Officer and Wildlife agencies, as necessary.
- Evaluate effectiveness of implemented adaptive management strategies and provide the BLM Authorized Officer and Wildlife agencies with recommendations based on findings.
- The TACG~~G~~ will terminate when the BLM Authorized Officer and Wildlife agencies determine~~s~~ that it is no longer a necessary pathway in reducing avian and bat impacts.

The TACG~~G~~ shall hold the first meeting ~~approximately six 6~~3 ~~months after~~prior to commencement of post-construction monitoring commences to review any final details of the monitoring plan. Subsequent meetings will be held ~~once a year~~following each monitoring season~~,~~ ~~typically~~ and after the end of ~~the~~ each annual monitoring cycle.

After the initial ~~6~~3-month period, ~~and after the first year of monitoring,~~ the TACG~~G~~ will review the findings for each monitoring season to determine if adjustments to the monitoring frequency are warranted based on carcass persistence trial and other study results. Desert Sunlight and the agencies will also meet at the end of the second year of monitoring to determine if continued/focused monitoring is warranted. Continued/focused monitoring may be warranted if data indicate that bird mortality caused by solar facilities is substantial and is having potential adverse impacts on special-status bird populations or there are other special circumstances. Such monitoring will be designed to address specific concerns that are identified after review of the data.

~~**Appendix A. Most Frequently Reported and Size Categories of Bird Species on e-Bird (eBird 2014) in Riverside County, California**~~

Appendix A. Most frequently reported bird species on e-Bird (eBird 2014) in Riverside County, California. Species are listed in decreasing order of frequency. Guild and size indicate classifications of these birds for reporting purposes. Birds 12 inches or greater in length are classified as a large bird, and 9 inches or less are classified as a small bird. Wingspan is used to determine classification of birds that are between nine and twelve inches in length, with a threshold of 18 inches.

Species	Guild	Size
house finch	Passerines	Small
common raven	Large Corvids	Large
black phoebe	Passerines	Small
mourning dove	Doves/Pigeons	Large
white-crowned sparrow	Passerines	Small
yellow-rumped warbler	Passerines	Small
red-tailed hawk	Diurnal Raptors	Large
American coot	Rails/Coots	Large
northern mockingbird	Passerines	Small
American kestrel	Diurnal Raptors	Large
Say's phoebe	Passerines	Small
mallard	Waterfowl	Large
European starling	Passerines	Small
great egret	Water-associated birds	Large
lesser goldfinch	Passerines	Small
killdeer	Shorebirds	Large
great-tailed grackle	Passerines	Large
red-winged blackbird	Passerines	Small
song sparrow	Passerines	Small
American crow	Large Corvids	Large
turkey vulture	Vultures	Large
California towhee	Passerines	Small
great blue heron	Water-associated birds	Large
verdin	Passerines	Small
Eurasian collared-dove	Doves/Pigeons	Large
northern flicker	Woodpeckers	Large
Bewick's wren	Passerines	Small
snowy egret	Water-associated birds	Large
common yellowthroat	Passerines	Small
Nuttall's woodpecker	Woodpeckers	Small
house sparrow	Passerines	Small
black-necked stilt	Shorebirds	Large
ruddy duck	Waterfowl	Large
double-crested cormorant	Water-associated birds	Large
bushtit	Passerines	Small
loggerhead shrike	Passerines	Small
Costa's hummingbird	Swifts/Hummingbirds	Small
ruby-crowned kinglet	Passerines	Small
western scrub-jay	Passerines	Small
eared grebe	Loons/Grebes	Large
rock pigeon	Doves/Pigeons	Large
ring-billed gull	Gulls/Terns	Large
western bluebird	Passerines	Small
western kingbird	Passerines	Small
western meadowlark	Passerines	Small

Appendix A. Most frequently reported bird species on e-Bird (eBird 2014) in Riverside County, California. Species are listed in decreasing order of frequency. Guild and size indicate classifications of these birds for reporting purposes. Birds 12 inches or greater in length are classified as a large bird, and 9 inches or less are classified as a small bird. Wingspan is used to determine classification of birds that are between nine and twelve inches in length, with a threshold of 18 inches.

Species	Guild	Size
pied-billed grebe	Loons/Grebes	Large
spotted towhee	Passerines	Small
northern shoveler	Waterfowl	Large
Cooper's hawk	Diurnal Raptors	Large
orange-crowned warbler	Passerines	Small
American white pelican	Water-associated birds	Large
phainopepla	Passerines	Small
California gull	Gulls/Terns	Large
red-shouldered hawk	Diurnal Raptors	Large
Gambel's quail	Upland Game Birds	Large
dark-eyed junco	Passerines	Small
Brewer's blackbird	Passerines	Small
northern harrier	Diurnal Raptors	Large
Cassin's kingbird	Passerines	Small
western grebe	Loons/Grebes	Large
house wren	Passerines	Small
northern rough-winged swallow	Passerines	Small
white-faced ibis	Water-associated birds	Large
black-crowned night-heron	Water-associated birds	Large
Savannah sparrow	Passerines	Small
American pipit	Passerines	Small
cliff swallow	Passerines	Small
greater roadrunner	Cuckoos	Large
tree swallow	Passerines	Small
American robin	Passerines	Small
barn swallow	Passerines	Small
greater yellowlegs	Shorebirds	Large
American avocet	Shorebirds	Large
ring-necked duck	Waterfowl	Large
least sandpiper	Shorebirds	Small
California thrasher	Passerines	Small
gadwall	Waterfowl	Large
American wigeon	Waterfowl	Large
acorn woodpecker	Woodpeckers	Small
yellow warbler	Passerines	Small
brown-headed cowbird	Passerines	Small
osprey	Diurnal Raptors	Large
Abert's towhee	Passerines	Small
Wilson's warbler	Passerines	Small
cactus wren	Passerines	Small
California quail	Upland Game Birds	Large
white-winged dove	Doves/Pigeons	Small
wrentit	Passerines	Small
marsh wren	Passerines	Small
white-throated swift	Swifts/Hummingbirds	Small
bufflehead	Waterfowl	Large

Appendix A. Most frequently reported bird species on e-Bird (eBird 2014) in Riverside County, California. Species are listed in decreasing order of frequency. Guild and size indicate classifications of these birds for reporting purposes. Birds 12 inches or greater in length are classified as a large bird, and 9 inches or less are classified as a small bird. Wingspan is used to determine classification of birds that are between nine and twelve inches in length, with a threshold of 18 inches.

Species	Guild	Size
ash-throated flycatcher	Passerines	Small
green-winged teal	Waterfowl	Large
Lincoln's sparrow	Passerines	Small
black-tailed gnatcatcher	Passerines	Small
oak titmouse	Passerines	Small
cinnamon teal	Waterfowl	Large
Caspian tern	Gulls/Terns	Large
Bullock's oriole	Passerines	Small
northern pintail	Waterfowl	Large
rock wren	Passerines	Small
long-billed dowitcher	Shorebirds	Small
mountain chickadee	Passerines	Small
hooded oriole	Passerines	Small
black-headed grosbeak	Passerines	Small
black-chinned hummingbird	Swifts/Hummingbirds	Small
Common Gallinule	Rails/Coots	Large
blue-gray gnatcatcher	Passerines	Small
green heron	Water-associated birds	Large
horned lark	Passerines	Small
white-tailed kite	Diurnal Raptors	Large
black-throated sparrow	Passerines	Small
Herring gull	Gulls/Terns	Large
Canada goose	Waterfowl	Large
American goldfinch	Passerines	Small
belted kingfisher	Kingfishers	Large
Bonaparte's gull	Gulls/Terns	Large
western tanager	Passerines	Small
white-breasted nuthatch	Passerines	Small
spotted sandpiper	Shorebirds	Small
yellow-headed blackbird	Passerines	Small
brown pelican	Water-associated birds	Large
ladder-backed woodpecker	Woodpeckers	Small
western sandpiper	Shorebirds	Small
band-tailed pigeon	Doves/Pigeons	Large
chipping sparrow	Passerines	Small
great horned owl	Owls	Large
cedar waxwing	Passerines	Small
lark sparrow	Passerines	Small
vermilion flycatcher	Passerines	Small
lesser scaup	Waterfowl	Large
blue grosbeak	Passerines	Small
hermit thrush	Passerines	Small
redhead	Waterfowl	Large

peregrine falcon	Diurnal Raptors	Large
sora	Rails/Coots	Small

Appendix A. Most frequently reported bird species on e-Bird (eBird 2014) in Riverside County, California. Species are listed in decreasing order of frequency. Guild and size indicate classifications of these birds for reporting purposes. Birds 12 inches or greater in length are classified as a large bird, and 9 inches or less are classified as a small bird. Wingspan is used to determine classification of birds that are between nine and twelve inches in length, with a threshold of 18 inches.

Species	Guild	Size
black-bellied plover	Shorebirds	Large
Steller's jay	Passerines	Small
violet-green swallow	Passerines	Small
western wood-pewee	Passerines	Small
prairie falcon	Diurnal Raptors	Large
mountain bluebird	Passerines	Small
sharp-shinned hawk	Diurnal Raptors	Large
long-billed curlew	Shorebirds	Large
Clark's grebe	Loons/Grebes	Large
black-throated gray warbler	Passerines	Small
warbling vireo	Passerines	Small
Virginia rail	Rails/Coots	Small
canvasback	Waterfowl	Large
Brewer's sparrow	Passerines	Small

Appendix B: Desert Sunlight Wildlife Incident Reporting System (WIRS)

DESERT SUNLIGHT
WILDLIFE INCIDENT REPORTING SYSTEM (WIRS)

BACKGROUND AND INTRODUCTION

Desert Sunlight will voluntarily implement a wildlife incident response and reporting system. Desert Sunlight will record and report all dead and injured wildlife including but not limited to birds found incidentally in the project areas over the entire life of the project as part of the project operations and monitoring efforts. The purpose of this Wildlife Incident Reporting System (WIRS) is to standardize the actions taken by site personnel in response to wildlife incidents found within project boundaries. The WIRS provides direction for site personnel who may encounter a wildlife incident in an effort to fulfill obligations in reporting wildlife incidents. Wildlife fatalities or injuries found by project personnel or others will be reported and processed following the protocols described in this document.

DESERT SUNLIGHT WIRS POLICY

This WIRS will be active for the life of the solar projects. All employees, contractors and subcontractors of Desert Sunlight have a responsibility to comply with all environmental laws and regulations. Most birds are protected by the federal MBTA, and eagles are further protected by the BGEPA. In addition, the state of California has an Endangered Species Act (CESA). Under the federal statutes, it is illegal to harm, harass, kill, or collect birds that may be found in the solar facility. A summary of these statutes is presented below. It is recognized that other wildlife including bats are generally not protected by federal or state law unless listed as a threatened or endangered species. However, it is the policy of FS to treat all wildlife incidents the same as avian incidents and include them in the WIRS.

It is illegal to collect an injured or dead bird without appropriate federal and state permits. **THE TOUCHING, POSSESSION, TRANSFER, OR TAMPERING WITH ANY WILDLIFE SPECIES (ALIVE OR DEAD) BY DESERT SUNLIGHT EMPLOYEES OR SUBCONTRACTORS IS STRICTLY PROHIBITED UNLESS CONSISTENT WITH PERMITS.** The WIRS is designed to provide a means of recording and collecting data about wildlife species found in the solar facilities to increase the understanding of solar and wildlife interactions. Desert Sunlight maintains an ongoing commitment to investigate wildlife incidents involving company facilities and to work cooperatively with federal and state agencies in an effort to minimize the potential for future bird and wildlife fatalities. The objective of this policy is to insure that the best available information about wildlife incidents found in Desert Sunlight facilities is recorded and the proper authorities are notified. It is the responsibility of Desert Sunlight employees, contractors and subcontractors to report all wildlife incidents as outlined in this WIRS.

APPLICABLE LAWS AND REGULATIONS

Migratory Bird Treaty Act

The Migratory Bird Treaty Act of 1918 (MBTA) (16 USC 703-712) is the cornerstone of migratory bird conservation and protection in the United States. The MBTA implements four treaties that provide for international protection of migratory birds. It is a strict liability statute wherein proof of intent is not an element of a "taking" violation. Wording is clear that most actions resulting in a taking or possession (permanent or temporary) of a protected species can be a violation, regardless of intent.

Specifically, the MBTA states: “Unless and except as permitted by regulations...it shall be unlawful at any time, by any means or in any manner, to pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess…any migratory bird, any part, nest, or egg of any such bird…(The Act) prohibits the taking, killing possession, transportation, and importation of migratory birds, their eggs, parts, and nests, expect when specifically authorized by the Department of the Interior." The word "take" is defined as "to pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to pursue, hunt, shoot, wound, kill, trap capture, or collect."

The MBTA protects 836 species of migratory birds (listed in 50 CFR 10.13), including waterfowl, shorebirds, seabirds, wading birds, raptors, and passerines. Generally, the MBTA protects all birds in the U.S. except upland gamebirds (e.g., pheasant, quail, etc), rock doves (pigeons), European starlings, and English house sparrows. Nearly all birds found at Desert Sunlight are protected under the MBTA.

Bald and Golden Eagle Protection Act

In June 1940, Congress signed into law the Bald and Golden Eagle Protection Act (BGEPA) (16 USC 668-688d) which affords additional protection to the bald and golden eagle. Specifically, the BGEPA states: “Whoever, with the United States or any place subject to the jurisdiction thereof, without being permitted to do so as provided…shall knowingly or with wanton disregard for the consequences of his act take, possess, transport…at any time or in any manner, any bald or golden eagle, alive or dead, or any part, nest or egg thereof shall be fined…that the commission of each taking or other act prohibited by this section, with respect to a bald or golden eagle, shall constitute a separate violation of this section." Penalties for violations of the BGEPA are up to $250,000 and/or 2 years imprisonment for a felony (violations are defined as a felony), with fines doubled for organizations. FS

Endangered Species Act

In 1973, the Endangered Species Act (ESA) (16 USC 1513-1543) was passed to protect endangered and threatened species and to provide a means to conserve their ecosystems. Under the ESA, Federal agencies are directed to utilize their authorities to conserve listed species, as well as "Candidate" species that may be listed in the near future, and make sure that federal agencies' actions do not jeopardize the

continued existence of these species. As with the MBTA and the BGEPA, the ESA as amended prohibits the taking of species listed under the act as threatened or endangered.

BLM Sensitive Species

BLM Sensitive Species are species designated by the State Director and includes only those species that are not already federal listed proposed, or candidate species, or State listed because of potential endangerment. BLM's policy is to "ensure that actions authorized, funded, or carried out do not contribute to the need to list any of these species as threatened or endangered."

California Fish and Game Code

Sections 3511, 4700, 5050, and 5515 of the California Fish and Game Code outline protection for fully protected species of mammals, birds, reptiles, amphibians, and fish. Species that are fully protected by these sections may not be taken or possessed at any time. CDFW cannot issue permits or licenses that authorize the "take" of any fully protected species, except under certain circumstances such as scientific research and live capture and relocation of such species pursuant to a permit for the protection of livestock. Furthermore, is the responsibility of the CDFW to maintain viable populations of all native species. To that end, the CDFW has designated certain vertebrate species as Species of Special Concern because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction**.**

DESERT SUNLIGHT WILDLIFE INCIDENT REPORTING

The following procedures are to be followed when Desert Sunlight personnel or subcontractors discover a wildlife fatality or injury while on site. These procedures are intended to be in place for the life of the project and are independent of the post-construction monitoring studies. Prior to the initiation of operations, on-site training will be provided to Desert Sunlight personnel and subcontractors regarding the implementation of this WIRS.

When To Use The WIRS - What Constitutes A Reportable Incident?

For the purposes of this reporting system, *incident* is a general term that refers to any wildlife species, or evidence thereof, that is found dead or injured within the wind project. Note that an incident may include an injured animal and does not necessarily refer only to a carcass or fatality.

An intact carcass, carcass parts, bones, scattered feathers, or an injured wildlife species all represent reportable incidents. Desert Sunlight personnel and subcontractors shall report all such discoveries even if you are uncertain if the carcass or parts are associated with the facility.

> A ***fatality*** is any find where death occurred, such as a carcass, carcass parts, bones, or feather spot (10 or more feathers).
>
> An ***injury*** or injured animal is any wildlife species with an apparent injury, or that exhibits signs of distress to the point where it cannot move under normal means or does not display normal escape or defense behavior.

Prior to assuming a wildlife species is injured, it should be observed to determine if it cannot or does not display normal behaviors. For example, raptors will occasionally walk on the ground, especially if they have captured a prey item. Raptors also "mantle" or hold their wings out and down to cover a prey item. These types of behaviors may make the wings appear broken or the animal injured. Identification of specific behaviors typical to the life cycles and distress behaviors of wildlife will be part of the Desert Sunlight wildlife training program. Always exercise caution before approaching an injured wildlife species. **Under no circumstances are site personnel that are not included in the SPUT permit allowed to handle carcasses or injured animals.**

Note: *Any incident involving a federally or state listed threatened or endangered species, bald eagle, or golden eagle must be reported to USFWS and/or California Department of Fish and Wildlife (CDFW) within 24 hours of identification. See project personnel listing for contact information.*

MATERIALS NEEDED TO REPORT AN INCIDENT

1. A copy of this WIRS

2. A Wildlife Incident Report Form (see Attachment 1)
3. Project Personnel Listing and Contact Information
4. Pencil, Pen
5. Camera
6. Flagging

DESERT SUNLIGHT WILDLIFE INCIDENT REPORTING PROCEDURES

The following procedures apply if the incident involves a **Wildlife Fatality** or **Injured Wildlife Species**:

- **Leave the subject animal in place**. A flag may be used to mark its location for easy finding while the data sheet is being completed. It is recommended that any flagging be marked with the date, time, and initials of the recorder. **DO NOT HANDLE THE CARCASS.**

- **Report** the find to the Site Operations Manager immediately.

- The Site Operations Manager shall complete the following steps:

    - **Photograph** the incident as it was found in the field. Take at least two pictures: a close up shot of the animal as it lays in the field and a broader view of the animal (marked by a flag) with the road, turbines, or other local features in the view. For the close up picture, place an object (e.g., radio, pencil, coin, etc.) next to the carcass for a scale of size.

    - **Prepare a Wildlife Incident Report Form.** The form and associated instructions are presented below.

    - **Report** the find to Desert Sunlight's Environmental Department.

The following procedures apply if the incident involves an **Injured Wildlife Species**:

- **Move** to a distance far enough away that it is not visibly disturbed or uneasy due to your presence. **DO NOT ATTEMPT TO CAPTURE OR HANDLE AN INJURED ANIMAL.**

- **Report** the find immediately to the Operations Site Manager

- The Site Operations Manager shall complete the following steps:

    - **Report** the find to the Environmental Affairs Lead immediately.

    - **Contact** a local rehabilitation center (*see contact list below*) for further instructions on handling and transport/pickup of the injured animal.

    - **Prepare a Wildlife Incident Report Form.** The form and instructions for filling out the form are provided below.

*** Any incident involving a federally or state listed threatened or endangered species or a bald or golden eagle must be reported to the USFWS and/or CDFW within 24 hours of identification. These**

incidents will be reported to the agency verbally by the Operations Manager or Desert Sunlight's Environmental Department.

Subject:	FWS comments on Genesis plan
Date:	Monday, December 08, 2014 11:27:43 AM
Attachments:	20141205_Genesis_BBCS_13Nov2014_usfws comments.docx HTH_Desert Sunlight Dectectability Study Report_Nov2013.pdf

Hi Eric et al.,
Attached are the FWS comments on the Genesis mortality monitoring plan. Much of it is the same as for Desert Sunlight because, by and large, WEST cut and pasted the plan. As such, this transmittal email very much resembles that which we sent to BLM with our comments on the DS plan.

First, the title of the document as a BBCS is inappropriate, as this document does not contain the necessary components of a BBCS and serves primarily as s a monitoring plan; additional work will need to be done to complete the BBCS.

Per the BLM's recommendations for the Genesis and Desert Sunlight plans, we have made changes to the text (in track-changes) within the constraints (2-yr monitoring period, 25% of the solar field, 100% of the fence line, and 50% of the gen-tie) established during various meetings between the BLM and NE. The biggest issues for us in this current iteration of the monitoring document are listed below. Some of these points were brought up by the BLM in its most recent meeting with NE on the Sunlight project and are expected to be carried forward and addressed for this, the McCoy, and Blythe project plans.

- We still assert that 25% coverage of the solar field is insufficient, especially as proposed (i.e., using distance sampling). BLM discussed this with WEST. Because the agencies do not believe that surveyors will be effective at detecting carcasses at the distances WEST had proposed under the Sunlight plan, WEST will develop a method for estimating the effective survey area. For Genesis, they do propose narrower transects; however, searcher efficiency trials are still necessary and should be done seasonally and/or whenever there is a change in staff conducting the monitoring.

- While we recognize that 2 years is the minimum time required for monitoring and the CEC/BLM have discretion to require additional years based on the incoming data, we remain concerned about this considering the project will be on the landscape for a minimum of 30 years. The species identified and the mortalities per species are likely to differ considerably between years and there is no way this variability will be captured in such a short time period. We recommend that periodic monitoring of the facility (panel area, gen-tie, and fence line) is performed at various increments for the life of the project, especially as other projects go online in the desert; this will allow us to better understand and evaluate cumulative impacts and the contribution of this facility to overall avian impacts.

- We are concerned that distance sampling has never been used for this application (mortality monitoring on wind and solar); the justification for using this methodology is not well supported in the document or by the detectability study that HT Harvey ran on the Desert Sunlight site (attached). The proposed plan is a hybrid of distance sampling and wind energy mortality monitoring methods that are based on different and not necessarily compatible assumptions. We have made our changes in consultation with known distance sampling and mortality monitoring experts and would encourage that independent experts be included in

discussions before any further revisions are made to the methodology. After some evaluation period, we should have the ability to modify the methodology, if necessary.

- We remain concerned about the monitoring intervals (7 and 21 days), which are not supported by the Corvus carcass surveys performed on the Desert Sunlight site, HTH's detectability study, and much of the available literature. We believe that these intervals coupled with the distance sampling method as proposed will result in significant under-sampling, which cannot be corrected for using statistics. Additionally, as proposed, surveys are unlikely to capture rare mortality events of uncommon and/or listed species, such as Yuma Ridgway's (clapper) rail.

- We remain concerned about using surveyors who do not have academic ornithological and field ecology/biology background. While training will be conducted, locating carcasses can be quite difficult, especially using distance sampling. Therefore, we added language that requires an Authorized Avian Biologist to be on-site during monitoring to provide oversight. The most recent SPUT report submitted by NE showed that for the month of October 2014, virtually none of the birds were identified; this supports the need for an on-site authorized biologist who is responsible for identification, proper data collection, including taking photographs, and determining cause of death, etc. BLM did express this concern in its transmittal email to WEST, First Solar, and NE on the Sunlight plan. However, we should reiterate this concern for this and other projects.

- If there needs to be a TAC, it should be open to public participation so that the process is transparent. We recommend seeking input from academic and NGO partners, as well as other consultants who have the appropriate expertise.

- BLM is currently working on a policy that requires third-party monitoring that eliminates confidentiality agreements; facilitates open communication to wildlife agencies from all project-related staff; requires submission of all raw data and methods; and makes all data available for peer review and assessment. We support this wholeheartedly and encourage CEC to support and implement this requirement for projects under its jurisdiction.

If you have any questions or concerns about our comments, please contact us. And please cc us on your transmittal to WEST and NextEra.
Thanks,

However, we should reiterate this concern for this and other projects.

- If there needs to be a TAC, it should be open to public participation so that the process is transparent. We recommend seeking input from academic and NGO partners, as well as other consultants who have the appropriate expertise.

- BLM is currently working on a policy that requires third-party monitoring that eliminates confidentiality agreements; facilitates open communication to wildlife agencies from all project-related staff; requires submission of all raw data and methods; and makes all data available for peer review and assessment. We support this wholeheartedly and encourage CEC to support and implement this requirement for projects under its jurisdiction.

If you have any questions or concerns about our comments, please contact us. And please cc us on your transmittal to WEST and NextEra.

Thanks,

Jody Fraser, Biologist

HTH_Desert Sunlight Dectectability Study Report_Nov2013.pdf

Per your request. Virtually the same as Desert Sunlight, but with CEC involved, the process is a bit different. Eric V. asked for the Tues meeting to reconcile some differences in agency comments. CEC, instead of BLM will transmit our comments.

Hi Eric et al.,
Attached are the FWS comments on the Genesis mortality monitoring plan. Much of it is the same as for Desert Sunlight because, by and large, WEST cut and pasted the plan. As such, this transmittal email very much resembles that which we sent to BLM with our comments on the DS plan.

First, the title of the document as a BBCS is inappropriate, as this document does not contain the necessary components of a BBCS and serves primarily as s a monitoring plan; additional work will need to be done to complete the BBCS.

Per the BLM's recommendations for the Genesis and Desert Sunlight plans, we have made changes to the text (in track-changes) within the constraints (2-yr monitoring period, 25% of the solar field, 100% of the fence line, and 50% of the gen-tie) established during various meetings between the BLM and NE. The biggest issues for us in this current iteration of the monitoring document are listed below. Some of these points were brought up by the BLM in its most recent meeting with NE on the Sunlight project and are expected to be carried forward and addressed for this, the McCoy, and Blythe project plans.

- We still assert that 25% coverage of the solar field is insufficient, especially as proposed (i.e., using distance sampling). BLM discussed this with WEST. Because the agencies do not believe that surveyors will be effective at detecting carcasses at the distances WEST had proposed under the Sunlight plan, WEST will develop a method for estimating the effective survey area. For Genesis, they do propose narrower transects; however, searcher efficiency trials are still necessary and should be done seasonally and/or whenever there is a change in staff conducting the monitoring.

- While we recognize that 2 years is the minimum time required for monitoring and the CEC/BLM have discretion to require additional years based on the incoming data, we remain

concerned about this considering the project will be on the landscape for a minimum of 30 years. The species identified and the mortalities per species are likely to differ considerably between years and there is no way this variability will be captured in such a short time period. We recommend that periodic monitoring of the facility (panel area, gen-tie, and fence line) is performed at various increments for the life of the project, especially as other projects go online in the desert; this will allow us to better understand and evaluate cumulative impacts and the contribution of this facility to overall avian impacts.

- We are concerned that distance sampling has never been used for this application (mortality monitoring on wind and solar); the justification for using this methodology is not well supported in the document or by the detectability study that HT Harvey ran on the Desert Sunlight site (attached). The proposed plan is a hybrid of distance sampling and wind energy mortality monitoring methods that are based on different and not necessarily compatible assumptions. We have made our changes in consultation with known distance sampling and mortality monitoring experts and would encourage that independent experts be included in discussions before any further revisions are made to the methodology. After some evaluation period, we should have the ability to modify the methodology, if necessary.

- We remain concerned about the monitoring intervals (7 and 21 days), which are not supported by the Corvus carcass surveys performed on the Desert Sunlight site, HTH's detectability study, and much of the available literature. We believe that these intervals coupled with the distance sampling method as proposed will result in significant under-sampling, which cannot be corrected for using statistics. Additionally, as proposed, surveys are unlikely to capture rare mortality events of uncommon and/or listed species, such as Yuma Ridgway's (clapper) rail.

- We remain concerned about using surveyors who do not have academic ornithological and field ecology/biology background. While training will be conducted, locating carcasses can be quite difficult, especially using distance sampling. Therefore, we added language that requires an Authorized Avian Biologist to be on-site during monitoring to provide oversight. The most recent SPUT report submitted by NE showed that for the month of October 2014, virtually none of the birds were identified; this supports the need for an on-site authorized biologist who is responsible for identification, proper data collection, including taking photographs, and determining cause of death, etc. BLM did express this concern in its transmittal email to WEST, First Solar, and NE on the Sunlight plan. However, we should reiterate this concern for this and other projects.

- If there needs to be a TAC, it should be open to public participation so that the process is transparent. We recommend seeking input from academic and NGO partners, as well as other consultants who have the appropriate expertise.

- BLM is currently working on a policy that requires third-party monitoring that eliminates confidentiality agreements; facilitates open communication to wildlife agencies from all project-related staff; requires submission of all raw data and methods; and makes all data available for peer review and assessment. We support this wholeheartedly and encourage CEC to support and implement this requirement for projects under its jurisdiction.

Hi Adrienne,
Thanks for the prompt response. I do not have final versions of either plan, so if you could send them to me, that would be great. They may be buried in Tera's email, but I don't have access to that right now.
Much appreciated,
Jody

Hi all,
I know FWS is working on issuance of the construction SPUT for this project, and will soon be processing one for Blythe as well; however, having recently taken these projects over from Tera, I'm not sure of the status of the raven mgmt plans for either of these projects, which serve as the foundation for the construction monitoring component under the SPUTs. Can someone please let me know the status? The most recent version I have for McCoy is from May...
Thanks,
Jody

Jennifer & Greg,
As requested by the Service's Palm Springs Fish and Wildlife Office, I am processing your SPUT permit application to authorize salvage of dead birds during construction for compliance with your Raven Management Plan. Although your application provides a written description of the project's location and a map, I need something more concise for the permit. Can you provide me with either a physical address for the project's location or GPS coordinates if there is not an actual address?

For clarification please correct or provide all the following to me in your response:

Records Location: 135 North Commercial Street, Blythe, CA 92225
Carcasses Collection Location:
Carcasses Stored: (freezer's physical location)

Thanks for your help,
Heather

Hello all,
For your review, please find attached consolidated agency comments on the most recent submittal of the BBCS for Genesis (GSEP), received on November 13, 2014. In large part, these comments are reflective of comments provided on the Desert Sunlight project with other items specific to Genesis. Comments have been made in the body of the document at the location of the language or instance.

I hope that by having this in your hands prior to the week of the Christmas holiday, that it is better for your review team, as I know various individuals are already beginning to take time off.

Thank you everybody for your hard work on this effort. Please let me know if you have any questions or concerns. I will be in office most of the days around Christmas and New Year's.

Subject: Genesis BBCS; consolidated comments for review prior to our discussion on Tuesday, 12/16

Hello all,
Please find attached a consolidated set of agency comments on the most recent submittal of the BBCS for Genesis (GSEP). As we were reviewing the document here at the Energy Commission, some inconsistencies were noted between different reviewers (based on what was discussed during our last call on 12/4). It is of course important to speak with one voice to NextEra Energy, so I am hoping we can iron out a few last items before sending it on to NextEra, I think we are pretty close. I would like to send the comments by 12/19 before people start leaving for the Christmas holiday.

Thanks everybody.

[INSERT APPROPRIATE R8 CONTACT INFORMATION] with any questions, problems, or suggestions for improvements to this form.

ABOUT THIS SPREADSHEET:

-Priority fields are indicated by an astericks and columns are shaded in grey. **At the very least, please try to populate all these fields, and any other applicable fields where possible, if that information is available.**

-**Drop down boxes are provided with several of the fields for your convenience, and to support greater consistency of data for these fields.**

-Please try to use one of the options provided within the drop down boxes for these fields. However, if you can not find the appropriate match in the drop down, you may enter your own text in the field as well.

-**If the option you select is "other" or contains the word "other" or you have additional details about your choice:** please try to provide additional details with your selection (again, all data entry cells in this spreadsheet will allow the entry of free text).

-**If you have been permitted to relocate a nest**, you may also report that relocation in this spreadsheet. This activity can be reported by use of the following fields: "Species Common Name", "Condition of Bird/Carcass (or if Active Nest Relocation, please indicate that here)", "Number of individuals found or number of nests relocated (if active nest relocation) " and "Disposition" (select the "Nest relocated" option).

IORTALITY REPORT FORM

tions and Information

Instructions for Eagle Injuries/Mortalities

IF YOU DISCOVER AN EAGLE:

If the eagle is dead, please complete the following steps:

1. Call your USFWS Office of Law Enforcement (OLE) point-of-contact Resident Agent in Charge (RAC) identified in your Special Purpsoe Utility (SPUT) permit conditions for instructions and approval before collecting or moving the carcass or its parts. You must contact OLE as soon as possible, but no later than 24 hours after discovery, to report the mortality.
2. Fill out as many of the fields in this sheet as possible regarding the incident, and send the report to your Regional USFWS Migratory Bird Permit Office as soon as possible.

If the eagle is alive, please complete the following steps:

1. Do not handle the eagle. Call your local migratory bird rehabilitation facility or a licensed veterinarian immediately for assistance.

2. Call your Regional USFWS OLE RAC identitied in your SPUT permit as soon as possible, but no later than 24 hours after discovery, to report the injury.

3. Fill out as many of the fields in this sheet as possible regarding the incident, and send the report to your Regional USFWS Migratory Bird Permit Office as soon as possible.

I wanted to let you know that BLM has accepted the attached BBCS for Desert Sunlight as final.

We cognize that it does not provide every element that the Service staff had identified, but the Bureau does think it will meet the requirements of the ROWG and provides sufficient flexibility to modify as it is implemented.

Thank you for all your assistance in getting this done. Hope you have a happy new year.

Amy

Please find attached the revised Desert Sunlight BBCS. We have include a redline/comment Word version and a "cleaned up" Word version with comments and redlines removed. The Redline version includes the USFWS comments and edits they made on the October 28th version, as well as our edits and comments/responses to those suggestions. We accepted many of their suggested edits, and provided responses when we felt like the suggested changes needed some additional edits, or where we might have respectfully disagreed with the edits or changes.

We want to thank you a bunch for moving this forward and working so hard near the holidays to get this plan in the shape it is in. We have adjusted the plan based on our agreed upon monitoring parameters that we had discussed extensively over the past week. If there is anything you would like to discuss in more detail, or need additional clarification, please feel free to give me a call. I will be available on my cell phone pretty much anytime between now and the end of the year with the exception of Christmas day to resolve any outstanding issues over the phone.

We are hoping that this plan in acceptable and we can move forward with implementation of this plan in January. We look forward to working with the BLM and the Wildlife agencies on this important monitoring project.

Have a great Holiday Season and thanks again.

Regards

Subject: Fwd: Revised Desert Sunlight BBCS

Hi Ray-
Here is the Avian Mortality Plan/BBCS that CA BLM accepted for the Desert Sunlight Solar Project.

While it is final, I do consider it to be a work in progress. The FWS staff still have some concerns, but agreed it was better to start collecting data. A critical component of this plan is that the results will be reviewed quarterly and if the approach needs to be modified it will.

Concerns have been raised that the mortality monitoring for the fence will just be conducted from inside the fence. This will be evaluated and may need to be altered to include monitoring from both side of the fence.

Concerns have been raised as to how the distance sampling will work, this will be evaluated and may require "tweaking".

Concerns have been raised as to how many carcasses are part of the searcher efficiency trials, the carcass removal trails, and whether sampling 25-30% of the solar field and the rest of the facilities is sufficient. We spent a lot of time hashing out the numbers because CA BLM was concerned that the correction values would be too large and our ability to really detect the effects (and determine whether adaptive management would be needed) might get lost in wide confidence intervals. If the confidence intervals are too wide -- more surveys will be added and mitigation will be assessed using the "high end" of the confidence interval. There was much discussion on how much monitoring with a high degree of precision was very costly. CA BLM agreed, but wanted to make it clear that if we accepted a monitoring protocol that might lead to wide confidence intervals, the grant holder could then not come back and argue that mitigation wasn't needed because of the uncertainty of the effects.

Just wanted to make sure you were aware of the major caveats of this plan -- and places where it might have potential weaknesses and how we are looking at addressing those weaknesses should they be real.

I know you asked Tom about sharing this with BLM AZ and BLM NV -- I have included the bio leads for these states... but am uncertain which other folks might also be interested in this. Please feel free to share. If you have any questions, I'd be happy to discuss.

Cheers!
A

Amy

Please find attached the revised Desert Sunlight BBCS. We have include a redline/comment Word version and a "cleaned up" Word version with comments and redlines removed. The Redline version includes the USFWS comments and edits they made on the October 28th version, as well as our edits and comments/responses to those suggestions. We accepted many of their suggested edits, and provided responses when we felt like the suggested changes needed some additional edits, or where we might have respectfully disagreed with the edits or changes.

We want to thank you a bunch for moving this forward and working so hard near the holidays to get this plan in the shape it is in. We have adjusted the plan based on our agreed upon monitoring parameters that we had discussed extensively over the past week. If there is anything you would like to discuss in more detail, or need additional clarification, please feel free to give me a call. I will be available on my cell phone pretty much anytime between now and the end of the year with the exception of Christmas day to resolve any outstanding issues over the phone.

We are hoping that this plan in acceptable and we can move forward with implementation of this plan in January. We look forward to working with the BLM and the Wildlife agencies on this important monitoring project.

Have a great Holiday Season and thanks again.

Subject: Updated Genesis BBCS - revision 3

Eric and Amy

Attached is an updated Genesis BBCS. Please distribute to others as necessary. This version includes the changes that Eric and the group made during our meeting on January 14th. In addition, we also made edits to address the remaining issues that were outlined and discussed on January 14th. All substantive changes that were made following the January 14th meeting have a reviewer identified as "WEST Updated Jan 15" to make it a little easier to follow. Some formatting changes that were done after Jan. 14 are identified as reviewer A. Palochak, who is a technical editor for WEST.

I believe we are getting very close to a final acceptable BBCS and we hope to get it finalized as a result of our meeting on Wed. Feel free to call me if you have any questions prior to our field day on Wed. We are looking forward to the site visit and meeting. As always, if you have any questions, feel free to give me a call.

Desert Sunlight TAG Members and Others

As a followup to our February 26th TAG meeting, please find attached the draft minutes from the meeting and other followup items requested by the TAG:

1. Draft meeting notes
2. WEST Presentation
3. Documentation of field biologist training
4. Final DSL BBCS
5. Pictures of the fence lines on the west and southeast that are problematic for sampling
6. Strawperson TAG meeting schedule. We can work to start to select dates if the TAG members are ok with general scheduling time frames below.

Here is a quick thought for TAG meeting schedule. This gives us a little more than a month to get the quarterly reports completed.

mid July - covers 1st Qtr Monitoring (Spring)

mid October - covers 2nd Qtr Monitoring (Summer)

mid Jan - covers 3rd Qtr Monitoring (Fall)

mid April - covers Annual Report (Annual)

Let me know what you think about the schedule, and whether you have any questions or thoughts regarding the other material sent.

Regards

Attachments:	DRAFT Desert Quartzite Agency Mtg Notes 3-12-15.docx Quartzite Private Lands-acre Prelim Bio Assess Draft.pdf

Howdy everyone,

Hope everyone is enjoying their day. The desert is a great place to be this time of year. Warm days and nice crisp nights. My rather large and moody male tortoise is a little anxious by the fact he can see the female tortoise if he gets on top of his burrow but he cannot figure out how to get to her. Don't let anyone tell you that tortoises don't try to figure things out. They are great escape artists.

Attached are the drafting meeting notes. I would like to have any comments back by Wednesday (3/25) of next week. Once I incorporate the recommend changes, I will finalize the notes and resend.

Also, I have attached the draft bio assessment for the Private Lands portion of the project. If you have any comments or questions on it, please feel to contact me about it. Once the additional biological surveys (rare plants, MFTL habitat assessment and avian bird transects) are completed on the private lands portion, we will update this document with those results.

I was going to send the main resource contacts the shapefiles as per the meeting request; however, it dawned on me that not everyone has the capability to use those files. Would anyone like in the same data in a .kml file for use on Google Maps? Let me know.

Anything I missed? Need any other information? Just contact me.

Have a whimsical Wednesday. Enjoy life by laughing often.

Hi Manuela and Chris,

Here are the documents that we discussed on today's call. I haven't had a chance to review the Genesis BBCS, but I'll look at that next week. I included the Letter that we sent with our primary concerns on the Desert Sunlight plan. I'll spare you the line by line recommended changes. I've also attached the paper that I mentioned, which has Beston as the lead author, but Scott is a co-author.

Cheers, Tom

Subject: McCoy SPUT consturction permit

Mr. Schneck,

Attached is your new Special Purpose Utility Permit for Nextera's McCoy Solar, LLC project. The permit authorizes you and your subpermittees to collect, transport and temporarily possess carcasses and partial remains of birds protected under the Migratory Bird Treaty Act (16 U.S.C. 703 et seq.) found on project property and rights-of-way, in accordance with permit conditions. Please read your permit carefully. This permit authorizes you to pick up bird carcasses during project construction only as required for compliance with your Raven Management Plan.

Following the permit conditions, bird carcasses may be used for searcher efficiency and scavenger removal trials; carcasses used in trials must be reported to the Service as outlined in your permit conditions. You may also transfer carcasses to authorized entities as allowed by the terms of this permit. To comply with your permit reporting requirements, we ask that you submit your data using reporting form 3-202-17. It is attached for your convenience.

Please let me know if you have any questions.

Thank you,

Heather

Hi Mr. Perry and Mr. Ross,

Please find attached the Center for Biological Diversity's scoping comments on the proposed Desert Quartzite project. I am also including two referenced articles that are not readily available on line as part of these scoping comments. The remainder of these references are books, which we do not have as pdfs.

I will send a copy of this letter and references via snail mail to you as well.

Please feel free to contact me with any questions.

Hey Mags,
You may want to give this a look. It's the "final" BBCS that was included in the final EIR/EA. They addressed our comments by punting to adaptive management. Not good.
Happy Friday!

Hi everyone,
I've attached the final BBCS for the Blythe Mesa project with some comments in comment bubbles. I'm not sure how we can get these comments incorporated, but I'm concerned about how it's written and the deferred monitoring and mitigation. What do you guys think? Kim, can you help facilitate getting a more meaningful monitoring plan? And them getting a SPUT permit?
Jody
P.S. I only skimmed the BUOW stuff.

Hi there,
I forwarded the BBCS to Amedee and Tom last week and JUST got off the phone with folks at Riverside Co. conveying outstanding concerns with the document. They are going to adjust their conditions to reflect some flexibility that allows us to revisit the document prior to construction. I've attached the version with my comments in comment bubbles (I clipped out just the general avian portion -- the majority of the document focused on BUOW).

The main issues:
No pre-project surveys were conducted for the project because it is sited mainly in fallow ag. A desktop review was performed.

Despite the prevalence of incidental data from various solar projects, the risk assessment dismisses our comments about avian/bat impacts based on the lack of standardized data collection so only addresses the utility lines and not the solar panels.

The document dismisses the importance of agricultural habitats for water-associated species, in particular within or adjacent to the Lower Colorado River Valley (i.e., part of the Pacific Flyway).

There is no mortality monitoring component up front -- it is deferred until various thresholds are met. Any site monitoring would be performed by project staff.

There is no condition for obtaining a SPUT permit.

There is no effectiveness monitoring or metrics articulated for proposed avoidance and minimization measures, leaving the adaptive management component largely incomplete.

That's the gist of the concerns. Let me know if you have any questions.
Thanks,
Jody

---

Hi Kim, Jody, and Magdalena,

Please find as attached the Q1 O&M bio report for Desert Sunlight. If you have any further questions regarding this report, please do not hesitate to contact us.

Hope all is well with everyone and you're enjoying the spring!

Thanks,
Lehong

Tom and Felicia,

On behalf of Kruger Energy and Stantec, attached is the pre-final version of the Seville Solar Complex Project BBCS addressing your comments.

We look forward to your final approval. Please let us know if you have any questions.

Thank you,

Kristin E. Smith

---

Thnx Brock - please include Jody, Tom and Jeep too in future reporting. What is the "non-project related wire" referring to--another nearby powerline or fence? were they within the Blythe right-of-way or incidentally found elsewhere? I sounds like some of the birds were being scavenged by ravens--is that right? Could you please provide a map as well for where these fatalities occurred? The others may have some follow-up questions too. thnx, Pete

Good morning Heather and Pete,

In accordance with the Migratory Bird Special Purpose Utility Permit (SPUT) issued for the Blythe Solar Power Project (MB58483B-0), the permit holder is to report a “Significant Mortality Event” which is defined as a discovery of 6 or more migratory birds that have been killed within a 24 hour period. Provided attached is the excel spreadsheet that includes the data requested by USFWS in accordance with Section E of the SPUT. As seen in the attached excel sheet two yellow warblers, two Wilson warbler and two Townsend warblers were identified on May 7th during day-to-day construction monitoring associated with construction of the gen-tie for the Blythe Solar Power Project.

Please let me know if you have any additional comments or questions,

Very truly yours,

BROCK A. ORTEGA

Good morning Pete,
We will be sure to include Jody, Tom and Jeep on future reporting related to the Blythe Solar Power Project SPUT Permit.

Provided below are responses to the questions presented below.

- **What is the "non-project related wire" referring to--another nearby powerline or fence?**
  - The Blythe Solar Power Project 230 kV transmission line is co-located along the same transmission structures as the McCoy Solar Energy Project. Provided attached is an exhibit that shows the alignment of the 230 kV transmission line for both the McCoy and Blythe projects. The McCoy Solar Energy Project transmission line is complete and currently the Blythe Solar Power Project 230 kV transmission line is under construction.
- **Were they within the Blythe right-of-way or incidentally found elsewhere?**
  - The mortalities are located within the Blythe right-of-way.
- **It sounds like some of the birds were being scavenged by ravens--is that right?**
  - That is correct, USFWS ID 04 and 05 were being scavenged by ravens at the time of discovery by the construction monitor.
- **Could you please provide a map as well for where these fatalities occurred?**
  - Yes. Please see attached.

Please let me know if you have any additional questions.
Best,

Brock

Tera,

Attached is the addendum to the BA for McCoy. Sorry this didn't get to you by Friday, but I tried to get the applicant to produce it faster. These numbers are the same that will be presented in the FEIS and I have ESA working to make sure they are current and accurate with the project description in the document.

I will be in the field tomorrow and off the rest of the week. Feel free to call my cell tomorrow if you have any questions.

SUBJECT: Biological Opinion Annual Reporting

Dear Ms. Noda,

The United States Garrison (USAG) Fort Irwin is submitting the attached annual reports per requirements outlined in two active active biological opinions. These two biological opinions (BO) are:

1. Reinitiation of Formal Consultation on the Army's Current Mission at the National Training Center, Fort Irwin, California (1-8-95-F-16R).

2. Proposed Off-Road Vehicle Area. U.S. Anny National Training Center, Fort Irwin. San Bernardino County. California (1-8-00-F-78).

The attached reports provide information in accordance with the reporting requirements outlined in each of the two biological opinions. The annual report for BO #1-8-03-F-48, Proposed Addition to Maneuver Training Lands at Fort Irwin, California, was previously submitted by separate correspondence

Should you have any questions regarding these reports please contact Clarence Everly. Fort Irwin Natural and Cultural Resources Program Manager. at (760) 380-3740, or via email at clarence.everly@us.army.mil.

Sincerely,

Lance K. Toyofuku
Director of Public Works
Fort Irwin, California

Biological Opinion # 1-8-95-F-16R
15 September 1995
Re-initiation of Formal Consultation on the Army's Current Mission at the National Training Center, Fort Irwin, California

INTRODUCTION

Pursuant to submission of a biological assessment identifying the potential effects of military training activities on threatened, endangered and sensitive species within the original boundaries of Fort Irwin and the National Training Center, the US Fish and Wildlife Service rendered a biological opinion. The Service stated in its opinion that the effects of military training activities described were not likely to jeopardize the continued existence of the desert tortoise or adversely modify critical habitat. The opinion further requires Fort Irwin submit an annual report summarizing:

1. the number of desert tortoises moved by authorized biologists
2. the number of desert tortoises killed or injured providing the specific information for each tortoise described in term and condition 12 of the opinion
3. any new ITAM program data
4. recommendations for modifying the terms and conditions to enhance desert tortoise protection
5. acreage disturbed, if any, below the UTM 90 line

RESULTS

Fort Irwin Directorate of Public Works (DPW) natural resources personnel conducted fifty-five (55) survey/monitoring efforts in support of projects on the installation during the reporting period. During this period there were thirty-seven (37) incidental observations of desert tortoises, twelve (12) of which were harassment takes involving movement of tortoises out of harm's way. There was one (1) desert tortoise mortality take during the reporting period.

Per the Biological Opinion for the Army's Current Mission at the National Training Center, Fort Irwin, California, Table 1 provides a listing of all desert tortoise encounters within the original Fort Irwin boundary reported to Fort Irwin personnel during calendar year 2011. In addition to recording these observations, DPW natural resources personnel, in accordance with term and condition 9, marked eight (8) previously un-marked tortoises encountered within the original boundaries of Ft Irwin using a uniquely numbered Floy tag. The purpose of this program is to allow for a passive system of monitoring Fort Irwin tortoises encountered by personnel throughout the installation. ID numbers of animals thus marked are included in Table 1. A total of fourteen (14) tortoises have been tagged since the program's inception (2010). Since tagging, none of these individuals have been reported within the training area. At such time that tagged individuals are re-observed, the animals' locations in relation to location at time of tagging will be plotted in GIS and included in subsequent reports.

Attachment 1

In 2011, there were a total of thirty-seven (37) incidental observations of live tortoises within the original boundaries of Fort Irwin as reported to DPW. Twenty-four (24) of these incidents involved strictly observation with no further action taken. Two (2) incidents involved floy-tagging unidentified tortoises but with no further handling; Six (6) incidents involved floy-tagging with short-distance (≤150m) relocations out of immediate harm's way (primarily out of roadways); four (4) long-distance (> 150m) tortoise relocations away from active training maneuvers and one (1) incident involving a juvenile tortoise recovered from the housing area on garrison. The origin of this tortoise (whether wild or captive) could not be confirmed and the animal was turned over to the High Desert Chapter of the Turtle and Tortoise Club (P.O. Box 163, Victorville, CA 92392) in accordance with direction from USFWS (personal communication with Mr. Ray Bransfield and Mr. Roy Averill-Murray).

Table 1. Desert tortoise encounters by DPW staff on the NTC & Fort Irwin in 2011.
UTM coordinates reported in Zone 11, NAD 83

Date (2010)	Easting	Northing	Age/Sex	ID#	Activity / Status/ Comments
3/15/2011	550800	3908100	Unknown	Unknown	In roadway - observed, not relocated.
3/22/2011	541900	3891300	Adult male	None	Near side of road but in no danger – observed, not relocated.
3/22/2011	544000	3907200	Adult male	None	Moving south near Tiefort mountain. Observed – not relocated.
3/30/2011	523344	3890038	Adult male	None	Observed north side of SEA fence line.
3/30/2011	525704	3888873	Adult male	4387	Observed north side of SEA fence line.
3/30/2011	526230	3888546	Adult female	4396	Observed south side of SEA fence line.
3/30/2011	528776	3887808	Adult	None	Observed south side of SEA fence line.
3/30/2011	528457	3887911	Adult	4302	Observed south side of SEA fence line.
4/4/2011	594000	3896900	Adult	Unknown	Observed along WEA fence line.
4/4/2011	520300	3898300	Adult female	None	Observed near Gemini antennae. Not relocated.
4/6/2011	514400	3894200	Adult female	5099	Observed in LMMV Conservation Area. Not relocated.
4/12/2011	560725	3918725	Adult	Unknown	Reported by contractor. Observed, not relocated.
4/14/2011	560072	3919523	Adult	Unknown	Reported by contractor. Observed, not relocated.
4/16/2011	529000	3895000	Adult	Unknown	Reported by training unit. Observed, not relocated.
4/22/2011	514600	3893900	Adult	5099	Observed in Brinkman Wash LMMV conservation area. Not relocated.

Attachment 1

4/23/2011	526800	3902200	Subadult	NTC1144	Tortoise recovered from roadway on garrison. Animal was relocated approximately 3 miles to Goldstone land.
4/23/2011	527500	3903500	Subadult	NTC1149	Tortoise recovered from housing area while resting beneath a parked vehicle. Relocated to nearest parcel of habitat west of garrison.
4/25/2011	521600	3913100	Subadult	NTC1016	Tortoise reported by soldiers in training area. Observed, tagged but did not relocate.
4/30/2011	522580	3921940	Adult female	None	A female tortoise was found in a burrow by OPS group. A 50-meter buffer zone was created to protect the burrow and potential eggs using seibert stakes.
4/30/2011	522580	3921940	Adult male	None	Tortoise reported by soldiers in training area. Observed but did not disturb animal.
5/6/2011	514875	3920371	Adult male	NTC1139	Tortoise walking along busy MSR roadway in training area. Tagged and relocated animal a safe distance (≤150 m) from MSR.
5/9/2011	504547	3895808	Subadult	5518	Observed by DPW biologists. Small adult tortoise with a transmitter. Did not disturb.
5/12/2011	527700	3913800	Adult	Unknown	Called-in observation by downrange personnel - could not contact to confirm details.
5/17/2011	551105	3908786	Hatchling	Unknown	Responded to a call from soldier during a maneuver. Determined that the hatchling tort was not in immediate harms way and was left in situ inside a shallow burrow.
5/19/2011	516710	3899301	Adult female	NTC1050	This animal had originally been recovered from the Jackrabbit Park and was relocated as per USFWS instruction to conservation lands (UTM reflects current location).
5/23/2011	533841	3916209	Adult male	NTC1055	Tortoise called in by soldier on training maneuvers. Animal was tagged and relocated out of immediate training area.
5/25/2011	523450	3992980	Adult	Unknown	Soldiers on maneuvers called in observation of adult tortoise. Animal was not disturbed.

Attachment 1

5/25/2011	523960	3891520	Adult	Unknown	Soldiers on maneuvers called in observation of adult tortoise. Animal was not disturbed.
6/20/2011	520680	3900199	Subadult	NTC1134	Animal reported on busy, paved roadway. Biologists responded to tag and relocate animal out of harm's way (≤150 m).
6/20/2011	523818	3895511	Adult	None	Tortoise reported by soldiers. Observed animal but did not disturb.
8/15/2011	540213	3898314	Adult	None	Tortoise was crossing trail during a vehicle convoy; tortoise was moved 100 meters in direction of travel by an ECT soldier trained in short-distance tortoise relocations; tortoise did not void its bladder.
8/20/2011	524300	3897800	Subadult	None	Tortoise reported near front gate crossing busy roadway. Animal was relocated 150 meters west in direction of travel.
8/24/2011	523796	3897080	Subadult	NTC1175	Tortoise observed on "wrong" side of tortoise fence bordering Ft Irwin road. Animal was placed on protected side of tortoise fencing and tagged.
9/17/2011	560000	3910400	Adult	Unknown	Tortoise recovered from construction project area by tortoise monitor. Moved out of harm's way ~150 m from activity.
9/19/2011	545500	3907500	Unknown	Unknown	Tortoise reported by contract personnel. Observed but did not disturb.
9/20/2011	528341	3915302	Adult female	NTC1051	Tortoise reported by soldiers on patrol. Observed and tagged animal but did not relocate.
11/8/2011	528000	3902000	Juvenile (~2 yr old)	None	Recovered from housing area. Could not confirm status as a wild tortoise and animal was relinquished to High Desert Chapter of the Tortoise Club.

Summary of 2011 Survey and Monitoring Efforts within the original boundaries of Fort Irwin

Listed below is a consecutive summary of all 2011 construction-related tortoise survey and monitoring efforts conducted within the original boundaries of Fort Irwin. All construction related survey and monitoring efforts for the year resulted in no (0) live tortoise encounters. Three (3) potential tortoise burrows were identified during three pre-construction survey efforts. These burrows were not active at the time of survey. Two (2) carcasses both consisting of

disarticulated bone were seen during two surveys. Both were more than a year old and had no signs of take due to military training.

- On January 18, 2011 two biologists conducted a pre-construction survey adjacent to the southern buildings of Diffat AlBahaira al Jaff where waste water and kitchen pits were being installed. The site was highly disturbed with little vegetation, as it was located next to a MOUT site and adjacent to a main supply route (MSR). No desert tortoises or their sign were encountered.

- On January 20, 2011 two biologists surveyed a two hundred by two hundred meter area before the installation of a shade structure on one of the buildings at Eastgate. Although the project area is close to undisturbed habitat where tortoises could be present, no desert tortoises or their sign were observed.

- On February 4, 2011 two biologists surveyed an area one hundred by one hundred meters near Granite Mountain where a trench was to be dug for splicing cables. The soil was very rocky and granite boulders littered the site. Neither desert tortoises nor their sign were encountered in the action area.

- On February 17, 2011 three biologists surveyed a site of a potential roadway construction project extending from Bruno Cave down into the northwest part of Drinkwater Valley. No desert tortoises were encountered during the survey; however, a category 5 burrow, which is a burrow in deteriorated condition possibly belonging, at one point, to a desert tortoise, was encountered. This project was later cancelled.

- On February 18, 2011 two biologists surveyed the future site of a walled compound with five buildings constructed on piers on a 50 m by 50 m plot of land east of Challenger Canyon. The soil type on site was poorly suited to burrowing. No desert tortoises or their sign were encountered during the survey.

- On February 20, 2011 two biologists surveyed the proposed locations of 12 target pits around TF Urban. No desert tortoises, their sign, or other sensitive species were observed however, three of the target pits were constructed prior to the biologists' arrival on the sites, and no determination could be made about the presence of desert tortoises in these areas.

- On February 21, 2011 two biologists surveyed the proposed location of eight target pits near Challenger Canyon. All of the proposed target pit sites are found in relatively rocky areas with soils and plant communities poorly suited to desert tortoises. No desert tortoises or their sign were encountered during the survey.

- On February 25, 2011 two biologists surveyed an existing trench which was slated to be repaired at Refrigerator Gap Strongpoint. The soil type at the site was considered poorly suited to the desert tortoise. No desert tortoises were encountered during the survey; however, a category 5 burrow, which is a burrow in deteriorated condition, not occupied but possibly belonging to a desert tortoise, was encountered.

- During the week of February 28, 2011 two biologists surveyed eight sites prior to the installation of target pits near Refrigerator Gap. The soil type was poorly suited to the desert tortoise. No desert tortoises were seen but a category 4 burrow, which is a burrow in good condition possibly belonging at one point to a desert tortoise, was encountered and determined not to be occupied or in current use.

- During the week of February 28, 2011 two biologists surveyed 8 target pit locations near TF Rural. All of the target sites had disturbances present in the form of vehicle tracks, UXOs (unexploded ordinance), fire damage, and bullet casings. No desert tortoises, their sign, or other sensitive species were encountered during the survey.

- During the week of February 28, 2011 two biologists surveyed the east end of Echo Valley prior to the installation of a 64 meter trench called Grassy Knoll Strongpoint. The soil type on site was considered poorly suited to the desert tortoise. No desert tortoises, sign, or other sensitive species were observed.

- On March 4, 2011 two biologists surveyed an area northeast of Limaville. The area had already been disturbed by military training and was located on a steeply sloping hillside. No desert tortoises or their sign were observed.

- On March 4, 2011 two biologist surveyed an area south of Drinkwater Lake prior to the construction of a small training village. The proposed action area is located south of Drinkwater Lake, in an area which has already been significantly disturbed by military training. Multiple roads run through the action area and existing target pits were observed at the eastern portion of the site. No desert tortoises, or their sign, were observed.

- On March 11, 2011 three biologists surveyed along the fence line between Drinkwater Lake and Leach Lake Pass, before the reduction of an existing berm. The closest historical desert tortoise sighting was less than 1 kilometer from the site, but no tortoises or their sign were seen during the survey.

- On March 16, 2011 two biologists surveyed an area north of Medina Jabal prior to the installation of kitchen grey water pits. The area had been disturbed by military training and multiple roads ran through the action area, which had very little vegetation growing anywhere on. No desert tortoises or sign were encountered.

- On March 17, 2011 two biologists surveyed a 100 x 100 meter area prior to the installation of kitchen pits at Abar Layla. The area was highly disturbed and no flora or fauna was observed. No desert tortoises or their sign were seen.

- On March 18, 2011 two biologists preformed a survey prior to the digging of grey water kitchen pits at al Sharq. The area was almost entirely devoid of vegetation, and the vegetation that remained was damaged due to vehicle tracks and training activities. No desert tortoises or their sign were encountered during the survey.

- On March 23, 2011 three biologists surveyed an area west of Matterhorn Mountain prior to a re-vegetation project. The action area is on a soil type suited to desert tortoises; however, it has become so disturbed that it is no longer suitable habitat for tortoises. No desert tortoises or their sign were observed during the survey.

- On April 21-23, 2011 four biologists surveyed an area of 490,000 square meters that would be graded for ammunition storage. The surveyed area is located in a large wash which would become inundated with water after major rain events. No desert tortoises or their sign were observed during the survey.

- On April 22, 2011 two biologists surveyed the FOB New York site. The area had numerous vehicle tracks, cleared areas, trash, and other signs of training throughout the site. Heavy training had damaged much of the vegetation. No desert tortoises or their sign were encountered during the survey.

- On April 22-28, 2011 four biologists surveyed an area slated for ammunition storage located east of Eastland. The soil type at the site was considered poorly suited to the desert tortoise. No desert tortoises or their sign were encountered during the survey.

- On May 2, 2011 three biologists surveyed ten target pit sites in Challenger Canyon. The area had numerous UXOs and other military readiness training remnants, such as bullet casings and blast holes. No desert tortoises or their sign were encountered during the survey.

- On May 19, 2011 two biologists surveyed a well drilling sight southwest of the Whale. Vegetation and the soil at the site appeared suited to the desert tortoise but no individuals or their sign were seen.

- On May 20, 2011 two biologists surveyed a well drilling site north of Bitter Springs MSR. The site was very sandy and thus not conducive to burrows of the desert tortoise. No desert tortoises or their sign were seen.

- On June 14, 2011 four biologists surveyed a well drilling site located on the NASA Goldstone Complex near the Goldstone Air Strip. The habitat appeared well suited to the desert tortoise however no desert tortoises or their sign were encountered during the survey.

- On June 14, 2011 four biologists surveyed a well drilling site located on the NASA Goldstone Complex near the western expansion area northern fence line. One desert tortoise carcass, consisting of parts of a bleached shell with several scutes, was found during the survey. Biologists estimated the tortoise had died at least one year previously.

- On June 14, 2011 four biologists surveyed a well drilling site on the NASA Goldstone Complex near the Mojave site. The site was dominated by saltbush. No desert tortoises or their sign were observed.

Attachment 1

- On June 14, 2011 four biologists surveyed a well drilling site located on the NASA Goldstone Complex on the north side of Goldstone Lake. It was located in a saltbush dominated plant community. No desert tortoises or their sign were observed.

- On June 14, 2011 three biologists surveyed a well drilling site located south of Langford Lake MSR and west of the Whale. The dominant perennial was creosote bush and existing roads crossed the area. No desert tortoises or their sign were encountered during the survey.

- On June 15, 2011 two biologists surveyed a well drilling site located just south of Pioneer/Debnam Pass MSR and west of Medina Wasl MOUT site. The vegetation on site was creosote bush scrub. No desert tortoises, their sign, or other sensitive species were seen.

- On June 15, 2011 two biologists surveyed a well drilling site located between the west edge of Nelson Lake and al Jaff MOUT site. The plant community on site was saltbush scrub and there were numerous vehicle tracks crossing the area due to military training. No desert tortoises or their sign were seen.

- On June 15, 2011 two biologists surveyed a well drilling site located just north of Pioneer/Debnam Pass MSR and east of FOB Seattle. The soil on site is considered poorly suited to the desert tortoise. No desert tortoises or their sign were encountered during the survey.

- On June 15, 2011 two biologists surveyed a well drilling site located just north of Pioneer/Debnam Pass MSR and west of Nelson Lake. The plant community was creosote scrub and vehicle tracks from military training crossed the site. No desert tortoises or their sign were encountered during the survey.

- On June 15, 2011 two biologists surveyed a well drilling site located north of Medina Wasl. Existing roads and vehicle tracks were common across the action area, where the dominant perennial was saltbush. No desert tortoises or their sign were observed.

- On June 15, 2011 two biologists surveyed a well drilling site located south of East Range Road MSR and northwest of Central Well. The action area was situated in a large wash which contained many roads and vehicle tracks. No desert tortoises or their sign were observed.

- On June 15, 2011 three biologists surveyed a well drilling site located north of Bitter Spring and Bitter Springs MSR. The action area was situated in a large wash containing roads and vehicle tracks. The dominant perennial was creosote. No desert tortoises or their sign or were observed.

- On July 8, 2011 two biologists surveyed a soil sampling site on Range 18, off of Barstow Road MSR. The survey area was near large disturbed areas and several berms on Range 18. No desert tortoises or their sign were encountered during the survey.

- On July 11, 2011 two biologists surveyed a soil sampling site on Range 17 off of Barstow Road MSR in the training area, surrounding the Range 17 tower. The area was originally a creosote scrub community but has been converted into a parking area for firing range activity on Range 17. No desert tortoises or their sign were observed.

- On July 26 and 27, 2011 four biologists surveyed the site of the eastward expansion of FOB Denver. The action area was situated in a large sandy area, where vegetation has been greatly reduced and disturbance included trash, UXOs, bullet shells, and roads crossing the area. Desert tortoise sign in the form of disarticulated bone was seen at the site; however, no burrows, scat, or individuals were encountered.

- On August 24, 2011 two biologists surveyed the earthen berms at FOB King prior to their de-construction. The site was northwest of Medina Wasl. The survey area was completely graded and surrounded by large, dirt berms. No desert tortoises or their sign were encountered during the survey.

- On September 1, 2011 two biologists surveyed several dirt roads between MOUT site Medina Wasl and FOB Seattle where a regarding effort was planned. The soil on site was considered poorly suited to the desert tortoise. No desert tortoises or their sign were observed.

- On September 8, 2011 two biologists surveyed 33 miles of trail slated to be improved in the G1-G3 training areas. All trails wind through creosote scrub where there are several denuded areas with no vegetation. No desert tortoises or their sign were observed.

- On September 8, 2011 two biologists surveyed trails in the LF4-LF5 training area. All trails pass through creosote scrub communities. No desert tortoises or their sign were encountered during the survey.

- On September 8, 2011 two biologists surveyed 22 miles of trails in the LF6-LF7 training areas. The existing trails pass through creosote scrub communities and several washes. No desert tortoises or their sign were encountered during the survey.

- On September 9, 2011 two biologists surveyed FOB Denver prior to the installation of kitchen pits to support a temporary mess facility. The action area is situated in a large sandy area, where vegetation has been greatly reduced. No desert tortoise burrows, scat, or individuals were encountered.

- On September 9, 2011 two biologists surveyed the proposed location where grounding for a radio broadcast tower was to be installed. The site was very disturbed with trash, discarded wood, wire, bullet shells, and an excess of roads across the area. No desert tortoise burrows, scat, or individuals were encountered.

- On September 12, 2011 two biologists surveyed existing trails in the E1-E2 training area. All surveyed trails go through creosote scrub communities where there were several areas denuded of vegetation. No desert tortoises or their sign were observed.

- On September 12, 2011 two biologists surveyed along an existing travel route, prior to the creation of a crater in John Wayne Pass, for a rotational training scenario. The action area is situated in a rocky canyon which is not conducive to desert tortoise burrows. No burrows, scat, or individual desert tortoises were encountered.

- On September 14, 2011 two biologists surveyed an existing roadway prior the creation of AinGhar Crater. The action area was situated in a mountainous area, in the middle of an existing trail, with rocky hills on either side. No burrows, scat, or individual desert tortoises were encountered on site.

- On September 15, 2011 three biologists surveyed prior to the construction of a trail ten meters wide, up a wash from 1STG Wadi, to a hill and along the adjoining ridge. The action area was situated in a large sandy wash and there were some vehicle tracks in the area. No burrows, scat, or individual desert tortoises were encountered.

- On November 9 and 15, 2011 two biologists surveys the trails of Hidden Valley prior to slated trail improvements. The survey area was dominated by creosote bush scrub. No burrows, scat, or individual desert tortoises were encountered.

- On November 10, 15, and 21, 2011 two biologists surveyors an area slated for trail improvements in areas G3 and H1 of the training range. The entire project area had been moderately to heavily disturbed by military vehicles. No desert tortoises or their sign were observed during the survey.

- On December 2, 2011 one biologist reviewed the site of an emergency rock removal from a roadway due to a vehicle fatality. Two large boulders were apparently pushed from mid-route approximately 10 meters onto the shoulder. The disturbance did not result in apparent impacts to desert tortoises or their habitat. The area is already highly disturbed due to ground training activity. .

One (1) desert tortoise mortality was recorded in the NTC training area and was likely a result of military training activity. The observation of a deceased tortoise on a two track trail was initially reported by military personnel. DPW biologists estimated the carcass to be approximately 2 to 3 months old. Given the location of the carcass in relation to the two track trail the apparent cause of death was vehicle strike. Given the condition of the carcass it was not possible to determine whether the tortoise had expired prior to being run over or if mortality actually occurred as the result of being run over.

There is no new ITAM program data to report at this time.

Fort Irwin has no recommendations or modifications to suggest at this time to improve or enhance desert tortoise protection.

No disturbance of lands occurred below the UTM 90 line as a result of training activities during this reporting period.

Biological Opinion # 1-8-00-F-78
Proposed Off-Road Vehicle Area,
U.S. Army National Training Center,
Fort Irwin, San Bernardino County, California

INTRODUCTION

Fort Irwin established an ORV Area for military personnel and their dependents to use in their leisure time. There was no authorized area for this type of activity on Fort Irwin. As a result, some soldiers and/or their dependents used various areas of the installation for ORV activity. The availability of a single, officially sanctioned location for ORV use will ensure that other areas of the installation are not further damaged by this type of activity, thereby protecting the desert tortoise and other sensitive species. The established ORV Area is the only authorized area on post upon which this activity is allowed. Established in 2003, the ORV area encompasses approximately 70 acres. It is completely enclosed by triple strand smooth wire and tortoise proof fencing.

Pursuant to a review of the current status of the desert tortoise, the environmental baseline for the action area, the effects of the proposed Outdoor Recreation Vehicle (ORV) Area and cumulative effects, the US Fish and Wildlife Service rendered a biological opinion. The Service stated in its opinion that the ORV Area, as proposed, is not likely to jeopardize the continued existence of the desert tortoise. The opinion further requires Fort Irwin submit an annual report summarizing:

1. Compliance with NTC and Fort Irwin Regulation 350-3 detailing the amount of use occurring at the ORV Area
2. Types and occurrences of violations, such as breaches of the perimeter fence
3. Corrective measures taken to prevent further violations if any occurred

RESULTS

The Fort Irwin Outdoor Recreation Center reported a total of one hundred one (101) users of the OHV area representing forty-two (42) days of use during calendar year 2011. Use has increased from 2010 as a result of the course being re-opened after a long closure in 2010 to effect safety improvements. However, the OHV area is again closed (October, 2011) indefinitely due to a lack of maintenance funding.

No desert tortoise encounters were reported within the boundaries of the OHV area. No violations of NTC and Fort Irwin Regulation 350-3 were reported or observed.

An Annual Report for the Fort Irwin Desert Tortoise Translocation Project

By K. Kristina Drake, Todd C. Esque, Kenneth E. Nussear, Brian M. Jacobs, Katherine M. Nolte, and Philip A. Medica

ABSTRACT

The threatened status of the Mojave population of the desert tortoise (*Gopherus agassizii*), in conjunction with the expansion of Fort Irwin National Training Center necessitated the development of a Translocation Plan (Esque *et al*. 2005). The Translocation Plan and the Recovery Plan (FWS 1994) outlined the need for baseline studies on resident tortoises within release areas to be accomplished prior to translocation in order to evaluate the current status of resident populations, and to provide a point of reference for later evaluation of the success of the translocation efforts. From 2005-2007, the USGS initiated studies researching movements, habitat use, behavior, and physiological characteristics of tortoises that would serve as residents and controls during impending translocations (Drake *et al*. 2006, Walden *et al*., 2007). Habitat condition was also characterized (2005, 2007-2009), using annual and perennial plant surveys on randomly located transects throughout the Translocation Area.

In March 2008, the USGS translocated 38 desert tortoises as part of a much larger translocation effort at Fort Irwin (Drake *et al.* 2008). These translocated tortoises, along with a subset of resident and control tortoises within the Translocation Area, have been closely monitored to determine whether there are any measurable physiological stresses that may be associated with translocation of this species. These efforts have included tracking via radio telemetry and monthly blood collection during months of above-ground activity (April-October). In 2009, we continued to monitor the physiological affects of translocation among translocated and resident tortoises in comparison to controls throughout the study area.

Over the past five years, scientists from the USGS Las Vegas Field station have worked in collaboration with scientists from several universities, Department of Interior agencies, and other field offices within USGS to broaden the knowledge obtained from the study animals and about the habitat in which they live, and much of this work has been published in peer reviewed literature. These studies include: research on using GIS decision support systems to prioritize translocation sites (Jill Heaton; University of Nevada-Reno, Thomas Leuteritz and other; Redlands Institute; Heaton et al. 2008), research on health and disease status (Kristin Berry, USGS), a study on the potential risk of predation due to ravens throughout the Translocation Area (Wendy McIntyre, Redlands Institute, University of Redlands; McIntyre et al. 2007, comparisons of the efficiency and cost effectiveness of trained dog search teams (K9) and human search teams (Mary Cablk, Desert Research Institute; Jill Heaton, University of Nevada-Reno; Nussear et al. 2008), laboratory analysis for physiological parameters of stress (Richard Tracy, Ken Hunter, Amy Barber, and Sally DuPre-University of Nevada-Reno) as well as understanding the effects of human population density, resource variability and subsidized predators on desert tortoise populations (Andrew Walde, Peter Woodman, William Boarman-ITS-QinetiQ; Roy Averill-Murray-U.S. Fish and Wildlife Service; Jeremy Mack, Kristin Berry-USGS; and Jill Heaton- University of Nevada-Reno; Esque et al. In Review).

INTRODUCTION

The desert tortoise (*Gopherus agassizii*) was listed as a threatened species by the U.S. Fish and Wildlife Service (FWS) in 1990, and critical habitat for the Mojave population was designated in 1994. In 2004, President George W. Bush signed the Fort Irwin Military Lands Withdrawal Act of 2001, authorizing Fort Irwin to expand its training activities into 110,000 acres of public land that had been designated as critical habitat, some of which were previously used for military training prior to the listing of the desert tortoise. As mitigation for disturbance of desert tortoise critical habitat, the U.S. Army and the FWS determined that all tortoises inhabiting the proposed UTM 90 Area (hereafter Southern Expansion Area or SEA, 23,214 acres), and Superior Valley (70,045 acres) would be translocated prior to military activity. Work described in this report includes some tortoises that originally resided in the SEA and were translocated in the Spring of 2008, and others that reside in the Translocation Area where tortoises from the SEA were moved.

Throughout this report we refer to three different experimental populations of desert tortoises: resident tortoises, control tortoises, and translocated tortoises. The distinction is important because one premise of this study is that each experimental population may respond to translocation differently and the research design is planned to test several hypotheses about multiple responses. Tortoises that originated in the SEA are referred to as translocated tortoises, and will keep that designation throughout the life of the study. This includes an estimated 640 adult tortoises, and 300 sub-adult and juvenile tortoises that were moved to 13 release sites in the Superior Cronese Desert Wildlife Management Area (DWMA), within the general area described in the Translocation Plan (Esque *et al*. 2005).

Tortoises residing in the Translocation Area were considered to be control tortoises prior to March 27th, 2008, when translocation occurred. From that date forward, kernel utilization distributions were calculated each month to identify spatial overlap between translocated and control tortoises. If a control tortoise was found to overlap spatially with the distribution of translocated tortoises, its treatment type was changed to resident. Once a tortoise was designated as a resident, it will keep that designation in perpetuity, even if it moves outside the range of any translocated tortoises. A population of over 300 resident and control tortoises residing in the translocation area has been part of our research prior to and after translocation for the last five field seasons.

Previous studies on translocation of desert tortoises have examined movements, site fidelity, survivorship, reproduction, habitat use, and pre-release conditions (Nussear 2004, Field 1999). Additional ecological parameters that were recommended for potential study in the Translocation Plan as a result of Fort Irwin expansion included stress, growth, incidence of disease, nesting success, recruitment, nutritional ecology, behavior, social interaction, and habitat characteristics including vegetation and geomorphology (Esque *et al*. 2005). Physiological stress may be particularly useful in measuring the potential effects of translocation on both translocated and resident tortoises in comparison with their control counterparts.

Animals respond physiologically to an array of external noxious or stressful stimuli, including predation attempts, harsh weather, habitat change and anthropogenic disturbances, through a rapid cascade of endocrine secretions within the hypothalamic-pituitary-adrenal (HPA) axis (Axelrod and Reisine 1984, Wingfield *et a*l. 1997). While the stress response is complex and involves a variety of endogenous mediators, the glucocorticoid hormones (corticosterone or

cortisol) generated via the HPA axis are most often associated with the stress response. In particular, elevated levels of cortisol or corticosterone (CORT) are seen in both acute and chronic stress, and these hormones have been used as "biomarkers" of an altered physiological state.

Capture, handling, and restraint of wild animals (which are all activities that occur during translocation to new habitats) have all been shown to cause rapid elevations in CORT. These elevated levels of CORT typically decrease within a short period of time following release, and may or may not have cascading impacts on immune function or other physiological factors; however this has not been studied in depth, especially in this species. Indeed, there is a dearth of research quantifying the long-term effects of translocations on CORT levels, and almost none correlating these protracted elevations in CORT (chronic stress) on the function of the immune system or long-term key life history factors. Thus, a very important element of assessing stress in desert tortoises as a function of translocation is making an explicit connection in the physiology of stress as assessed by endocrine markers to immune competence as measured by ability to mobilize immune mechanisms over time. We suspect that if an animal's physiology is altered due to chronically elevated stress then we would expect to see impacts to ecological performance, such as reproduction, movements and habitat use, and behavior.

It seems likely that the translocation may cause acute stress in tortoises and that CORT levels may be elevated as a result. However, it is unknown whether this acute stress is important to the immune competence of translocated tortoises or if translocation will cause a more chronic stress to translocated tortoises as they continue to adjust in their new environments. It is also unknown what stress (acute or chronic) might occur in resident tortoises whose population has been supplemented by translocated tortoises or if any of the acute or chronic stresses affecting translocated or resident tortoises will result in a loss of immune competence or long term ecological compromise; although previous translocation studies have documented equivalent reproductive effort between residents and translocated tortoises (Nussear 2004). If any of these stressors compromise immunity or key life history factors, then the process of translocation could subject individual tortoises to increased vulnerability.

The Fort Irwin Translocation Project has facilitated a wealth of information on the ecology, behavior, habitat use, and distribution of desert tortoises. Through extensive coordination with Kristin Berry (USGS) and ITS-QinetiQ, collectively more than 48,000 tortoise observations have been recorded over the past five seasons. Thanks to such cooperation, this comprehensive dataset has enabled us to understand habitat use and movements of both translocated and resident populations to an extent that would otherwise not have been possible.

MATERIALS AND METHODS

Study Area

The Translocation Area is an ~ 1000 km^2 area of the Superior-Cronese Desert Wildlife Management Area (DWMA), located within the Western Mojave Recovery Unit. It is bounded on the south by Interstate 15, on the north by the southernmost boundary of Fort Irwin, on the west by the 508000 East Universal Transverse Mercator (UTM) line, and on the east by the

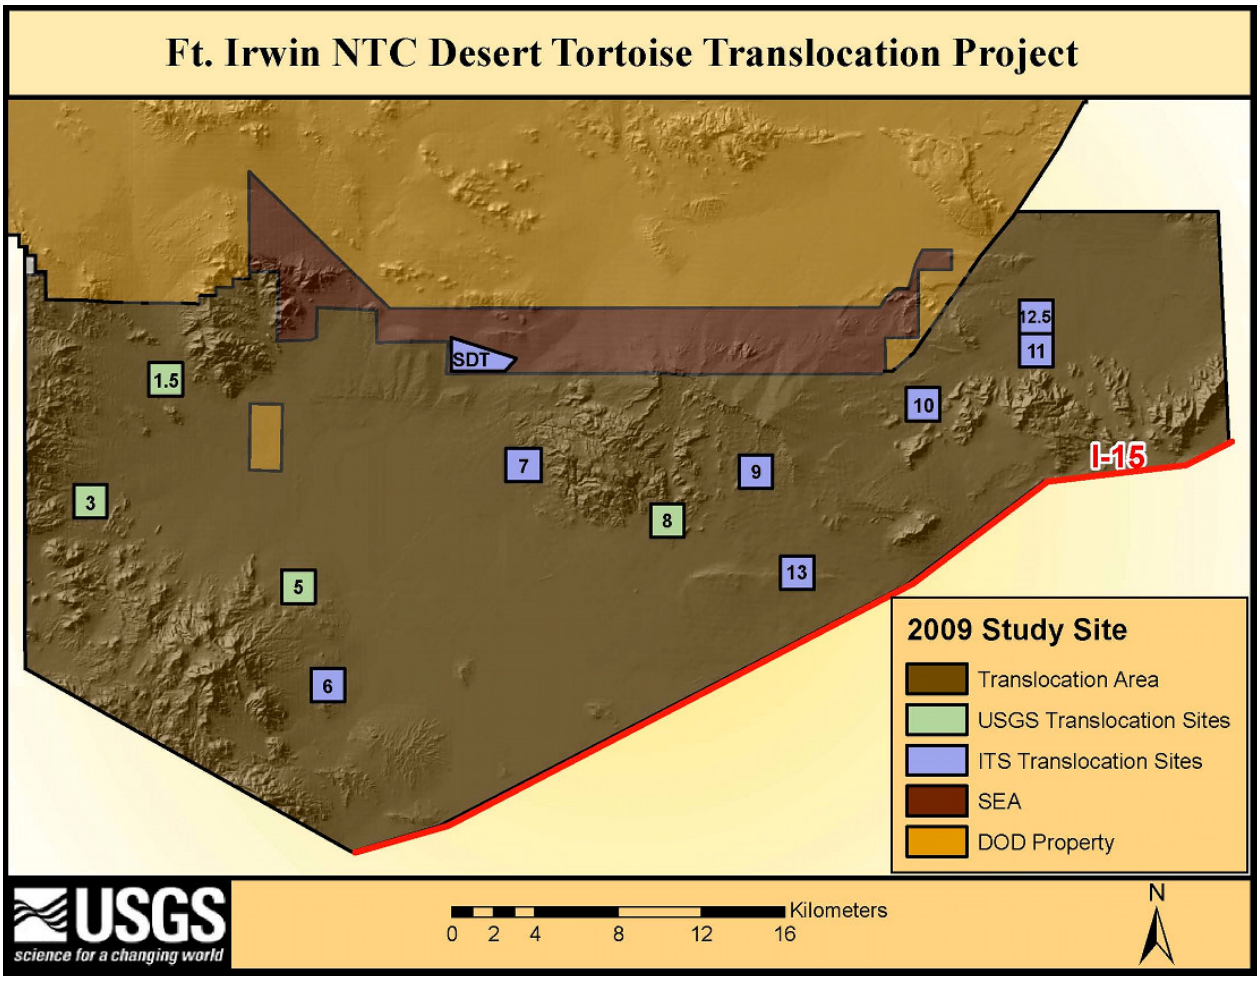

Figure 1. Map of the Translocation Area study area utilized in 2009.

568000 East UTM line (Figure 1). The Translocation Plan originally discussed 12 figurative plots of 1.6 km^2 (1 mi^2) that were to serve as release sites for 50 to 70 translocated tortoises each (Esque *et al*. 2005*)*. These plots were originally established in 2006 (Drake et al. 2005), but due to changes in landscape use, property ownership, prevalence of disease and site accessibility prior to translocation, several of these sites were removed as release sites. The USGS utilized plots 1.5, 3, 5, and 8 as research sites. Additional plots (6, 7, 9, 10, 11, 12.5, 13, and SDT) were also used by ITS as release sites for translocated tortoises.

The Southern Expansion Area (SEA) is bounded on the north by the 3890000 North UTM line, on the south by the 3887000 North UTM line, on the east by the 550000 East UTM line, and on the west by the 523000 East UTM line (Figure 1).

Study Animals

During 2005 and 2006, 306 tortoises were encountered and measured by USGS personnel to establish a robust sample of resident and control populations in the translocation area. Most of these were originally marked in 2005 (n=258) with an additional 48 being added in 2006. These tortoises were tracked monthly using radio telemetry as required by FWS and the California

Department of Fish and Game (CDFG) permits and blood was collected from a subset to begin ascertaining baseline stress values. In 2007, to reduce interference with concurrent research projects, we re-focused our efforts to monitor and collect blood from a subset of 120 tortoises (80 control and 40 translocated). Blood samples were collected from our study animals during these three years and should provide a representative baseline for stress levels that can be compared with post-translocation levels.

In 2008, we continued to monitor these animals and added an additional 6 tortoises to the study for a new population of 126 (86 control and 40 translocated). On March 27, 2008, USGS personnel translocated 38 tortoises from the SEA to four release plots (1.5, 3, 5 and 8) within the Translocation Area. Tracking commenced daily for the translocated tortoises for a period of 4 weeks, followed by weekly tracking of all tortoises in the study. In 2009, we continued monitoring these animals (11 control, 46 resident, 21 translocated) as well as collecting blood once a month from April-October. Monitoring animals across a large study site has provided the opportunity to simultaneously learn about ecological parameters, including movement, habitat use and their general behavior, while collecting data that address physiological parameters such as stress.

A total of 364 tortoises have been encountered and measured throughout the study area over the last five years. In addition to the 306 tortoises found in 2005-2006, 44 tortoises that had previously been marked by other researchers were incorporated into the stress assessment. In 2009, an additional 14 tortoises were added to the study; eight transferred from ITS and 6 from the inclusion of newly found individuals. Data gathered over the last five years has allowed us to compare resident and control responses to the translocation over the short and long term tenure of the program as defined in the Translocation Plan.

Animal Capture

1. Data Collection and Measurements

Data collected upon each encounter with a tortoise included date, time, observer, local climate, microhabitat, and geographic location. Some encounters resulted in the handling of animals for the purposes of measurement, transmitter attachment or maintenance, or blood sampling. For those encounters we also recorded temperature, data on the measurements of the mass and shell dimensions of animals, information associated with transmitter attachment and/or the collection of blood samples (Appendix 1).

Data were recorded using Garmin Ique 3600 PDAs or Trimble Juno SB Handheld Computers running Pendragon Software (v 5.3) as well as on paper datasheets.

2. Physical Measurements and Marking

Physical measurements of tortoises were taken during their initial capture and/or at the beginning of the activity season for each year. All tortoises were captured when temperatures were below 95^{o} F within 5 cm of the shaded ground surface. These measurements included several shell dimensions measured using metal calipers, including: midline carapace length (CL), the length of the plastron between the notches of the gular and anal scutes, the shell width between the fifth and sixth marginals, and the maximum shell height. Tortoises were also weighed to the nearest 5 g using a field portable digital scale. A uniquely numbered paper tag was attached with epoxy to a depressed portion of a vertebral scute for identification.

In May 2008, most tortoises in our study were notched using the Highly Modified Honegger System (Honegger 1979, Appendix 2) with notching methods derived from Cagel (1939). It is a modification of a system developed by Froese and Burghardt (1975) and uses numbers 1, 2, 4 and 7 along the marginal scutes. There were some exceptions with animals used in a previous study with non-numeric designations (ADG, ABR and BCI). These tortoises have been assigned a numerical identification and will be notched in the upcoming season.

3. General Health Assessment
Each tortoise was visually inspected for injuries, morphological anomalies, ectoparasites (e.g., ticks), and obvious symptoms of shell disease (cutaneous dyskeratosis), osteoporosis, and upper respiratory tract disease (URTD) when first marked, and upon each encounter if the tortoise was visible. This basic health assessment was recorded for general characterization only. A more thorough health assessment of these animals was conducted by Kristin Berry (USGS).

4. Habitat Assessment
Several microhabitat characteristics were recorded upon each encounter with a tortoise. These included general characteristics of the tortoise's location (hill, wash, open scrub, etc.), soils (cobble, sandy loam, sand, etc.), and specific microhabitat (sun, shade, burrow, etc.), and the tortoise's behavior (basking, eating, etc.; Appendix 1). When the microhabitat of the tortoise was associated with perennial vegetation, the species and dimensions of the vegetation were recorded for later analysis.

In order to determine patterns of burrow use, burrows used by tortoises were identified by a uniquely numbered non-reflective burrow tag attached with epoxy to a rock near the burrow. Burrow azimuth and associated perennial vegetation species were also recorded.

5. Transmitters
Transmitters were attached to all tortoises included in the stress study (CL $\geq$ 180 mm). The mass of the attached transmitter was 9.7 g, 13.8-15.0g, 17.0 g, 19.5g, or 25.5-27.5 g depending on the size of the tortoise and availability of transmitters. The different transmitter sizes were due to different battery configurations, where larger and heavier batteries provide longer transmitter life.

During 2009, transmitters were only attached to the first costal scute with putty epoxy, and only one segment of plastic tubing was used to attach the antenna to the second costal scute (Figure 2). The rest of the antenna was allowed to trail freely. A small dab of silicone sealant was placed between the head of the transmitter and the first tubing segment to reduce the risk of entanglement (e.g., with low lying branches of shrubs).

Figure 2. Desert tortoise. Photo taken by B. Jacobs – USGS.

If a transmitter that had already been attached to a tortoise was discovered to be functioning improperly, it was removed by carefully levering the putty off of the scute while avoiding damage to the carapace. Once the transmitter was safely removed, all remaining putty was removed and a new transmitter was affixed.

6. Blood Collection

Blood samples were collected to examine reproductive and seasonal endocrine patterns to aid in understanding the baseline levels and physiological parameters of stress. During 2009, attempts were made to collect samples monthly (April-October) from individual tortoises within each experimental population (resident, control and translocated) based on availability.

Blood samples were collected within the first 15 minutes following initial disturbance of the animal. Between May 10, 2005 and July 25, 2006, a subset of blood samples were collected using a 1.91 cm, 25-gauge needle-IV infusion set and 3 cc sterile syringe to obtain blood from the jugular vein (Jacobson *et al*. 1992). Between May 11, 2006 and October 3, 2009, blood samples were collected using a 3.81 cm, 23-gauge or 25-gauge needle and 3 cc sterile syringe coated in heparin to obtain blood from the subcarapacial sinus (Hernandez-Divers *et al*. 2002). Once collected, blood was transferred into labeled microtainers® containing lithium heparin to prevent coagulation. Throughout 2009, less than 0.5 ml of blood was collected from each

individual most months and a maximum of 1.2 ml of blood was collected from select individuals in which additional blood was requested for health screening. Blood samples were immediately stored on ice in small field portable coolers for no more than five hours. The samples were then centrifuged at 3400 rpm for ten minutes to separate the plasma from the red blood cells. Plasma and red blood cells were then extracted using a micropipette and placed into labeled cryogenic vials, which were immediately stored in liquid nitrogen. All samples were stored at field stations in Barstow, California and Las Vegas, Nevada until they were transported to the University of Nevada-Reno for analysis.

Notes were recorded at the time of blood collection describing the sample color, consistency and unusual characteristics. After blood processing, the estimated percentage of packed red blood cells (hematocrit) and percentage of lymphatic fluid present in each sample were recorded. These notes were used to categorize plasma samples based upon the estimated amount of lymphatic fluid present: free (0%), low (1-15%), medium (16-30%), high (31%+), or undetermined (field notes inconclusive).

7. Plasma Analysis

Plasma samples yielded from most plasma samples collected from 2005-2009 from wild tortoises were analyzed for total CORT concentration using a commercially available ^{125}I radioimmunoassay (RIA) from MP Biomedicals (Costa Mesa, CA; cat. no.: 07-120-102), which is comparable to commercial enzyme-immunoassays (EIA). This RIA kit has been used successfully in a variety of non-laboratory species including birds, reptiles and mammals (Martin *et al*. 2007). This assay is highly specific, having low cross-reactivity with other steroids. Unlike older RIA protocols, this assay does not require laborious steroid extraction steps and includes a CORT binding globulin (CBG) blocking agent, allowing the concentration of total CORT to be measured, without additional chemical or heating steps to denature the CBG protein.

The MP Biomedicals RIA has been validated for the measurement of total CORT in the desert tortoise. The assay can detect concentrations of CORT in the high pg/ml to low ng/ml range, sufficiently sensitive for measurements of total CORT in the desert tortoise, which typically show plasma CORT concentrations < 10 ng/ml most times of the year (Lance et al. 2001). The average intra-assay coefficient of variation was 6.5%, demonstrating that the same sample within the assay results in similar values.

8. Animal Movements

Each transmittered tortoise involved in our stress research study (n=83) was tracked at least monthly from January to December 2009. However, the tracking schedule was not constant for all tortoises. Some tortoises traveled further from their last known location than was detectable by telemetry and thus we required longer periods of time to locate them. Regular attempts to track problematic animals were made and recorded at least monthly. No animals previously tracked by USGS personnel were considered "lost" to the study due to transmitter or tracking failure in 2009.

Movement patterns were characterized for each experimental population using the mean 'Start To End' distance (defined as the distance between the first and last observations for the year) and the 'Maximum Annual Distance' (defined as the maximum distance moved from first location during the entire year). Movement patterns were analyzed with an analysis of variance using R statistical software (2.10.1, R Development Core Team 2009).

9. Treatment Designation
Prior to translocation, experimental treatment populations were limited to control tortoises (those originally residing in the Translocation Area) and translocated tortoises (those residing in the SEA). After translocation, all tortoise locations (n=48,000) collected from collaborating researchers were used to calculate monthly kernel utilization distributions in R using the package adehabitat v 1.8.2 (Calenge 2006) for each experimental treatment group (control and translocated). We used the ad hoc method to calculate a smoothing parameter (h) and a 95% confidence level. Utilization distributions were then imported into ArcGIS and evaluated for spatial overlap between treatment groups. If the spatial distribution for a control tortoises was found to intersect the translocation distribution on the landscape, its treatment type was reclassified as a "resident" tortoises. Once a tortoise became a resident, it retained that designation thereafter.

Locations were also used to estimate home-ranges for each animal in R using the package adehabitat v 1.8.2 (Calenge 2006). We calculated an individual based smoothing parameter (h), and home range area based on a 95% confidence level.

Vegetation Characterization

Annual Vegetation Sampling
Transects were sampled from March 23 to April 9, 2009 to determine annual plant productivity. In the Mojave Desert, winter annuals tend to set seed and die by June (Went 1948), so sampling was completed before the annual plants began to senesce. Starting points for the vegetation transects in 2009 were chosen from the same set of random points that were used for vegetation analysis in 2005 and 2008. Each transect was 200 m in length and extended in a random direction consistent with the line sampled in previous years (Figure 3).

Twenty quadrats measuring 1 m^2 were sampled at random distances along each transect. The amount of annual vegetation (biomass) in each quadrat was ranked using calibration methods similar to those of Andariese and Covington (1986) and Tausch (1989). In this method, the amount of vegetation in each quadrat was subjectively ranked on a scale of 0 to 10 by ocular estimation where 0 = absolute absence of any annual plant material and 10 = complete cover within that 1 m^2.

To confirm that the subjective ranks could be used to quantify production, a calibration curve based on the biomass of plants, in mass per unit area, was determined by clipping the above ground vegetation from two representative quadrats (10%) along each transect. Subsequently, standing annuals were clipped and sorted by phenological condition (i.e. those from the current year and those suspected to be from previous years' growth) for each quadrat. Calibration curves were constructed separately for each phenological condition and for each team of observers. After an initial weighing, all plants for each clipped quadrat were dried at 50ºC for 48 hours to remove all moisture before being weighed a final time. The mass of the new plants in each clipped quadrat was regressed against the observers' subjective ranks to generate an equation expressing those ranks as a function of measured plant biomass (Andariese and Covington 1985, Singh *et al*. 1990). This calibration value was then used to estimate the biomass for all quadrats that were sampled.

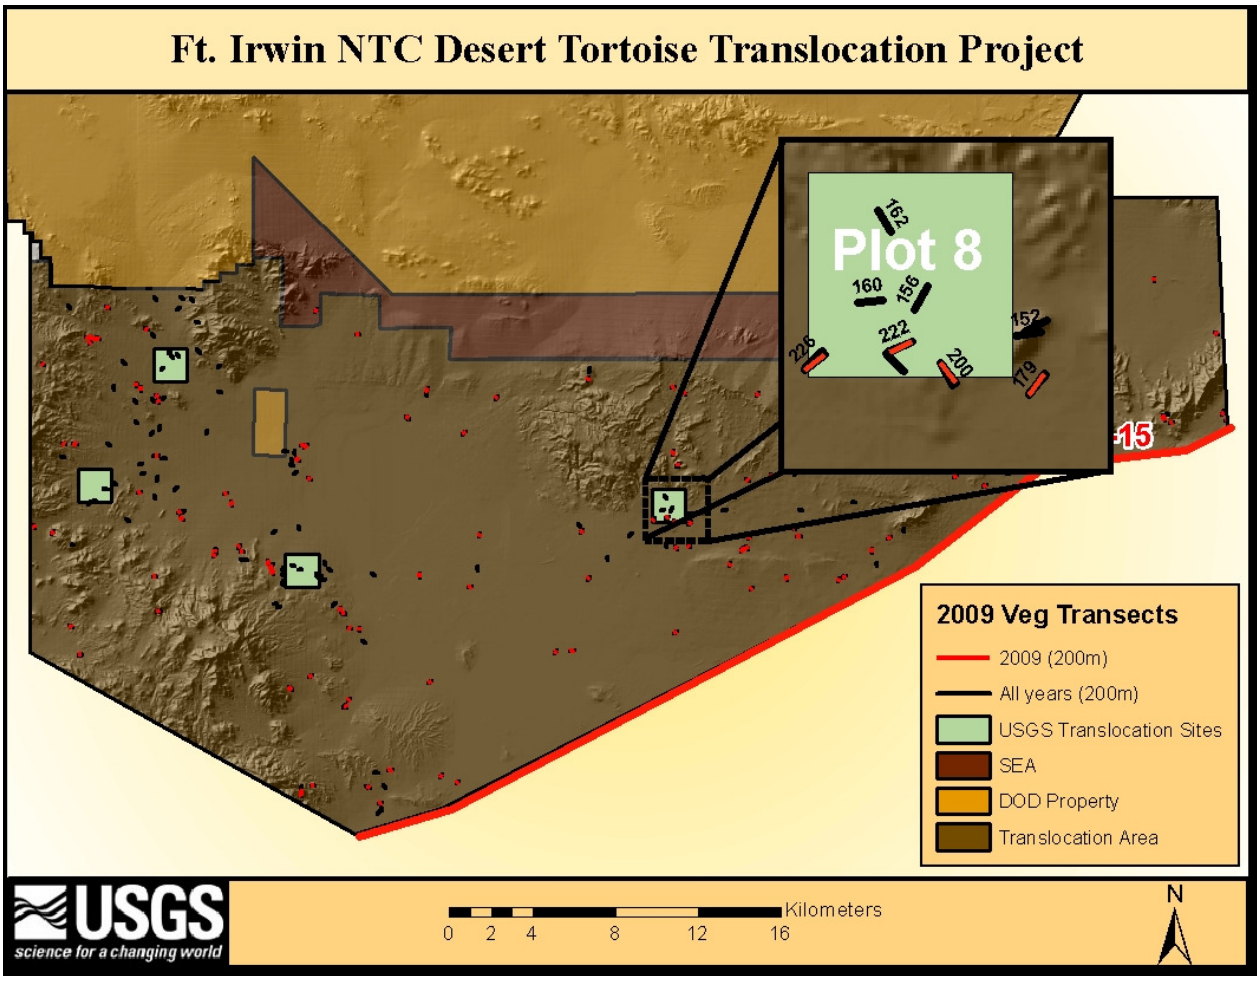

Figure 3. Vegetation transects for four years of sampling.

RESULTS

Results for this project from May 9, 2005 through December 12, 2005 (2005) were reported in Drake *et al*. 2006. Results from December 13, 2005 through October 31, 2006 (2006) were reported in Walden *et al.* 2007. Results March 27, 2007 through December 6, 2007 (2007) were reported in Drake *et al*. 2008. Results from January 14, 2008 through December 5, 2008 (2008) were reported in Drake *et al*. 2009. This report includes results from January 6, 2009 through November 23, 2009 (2009). However, some results from 2005, 2006, 2007 and 2008 have been included within select figures and tables for comparison among years and are indicated where applicable.

Summary of Encounters

In 2009, our research focused on monthly monitoring and sampling of a select group of tortoises within each experimental population. In January 2009, these tortoises included 11 control tortoises, 46 resident tortoises, and 21 translocated tortoises (Figure 4; Table 1). All further

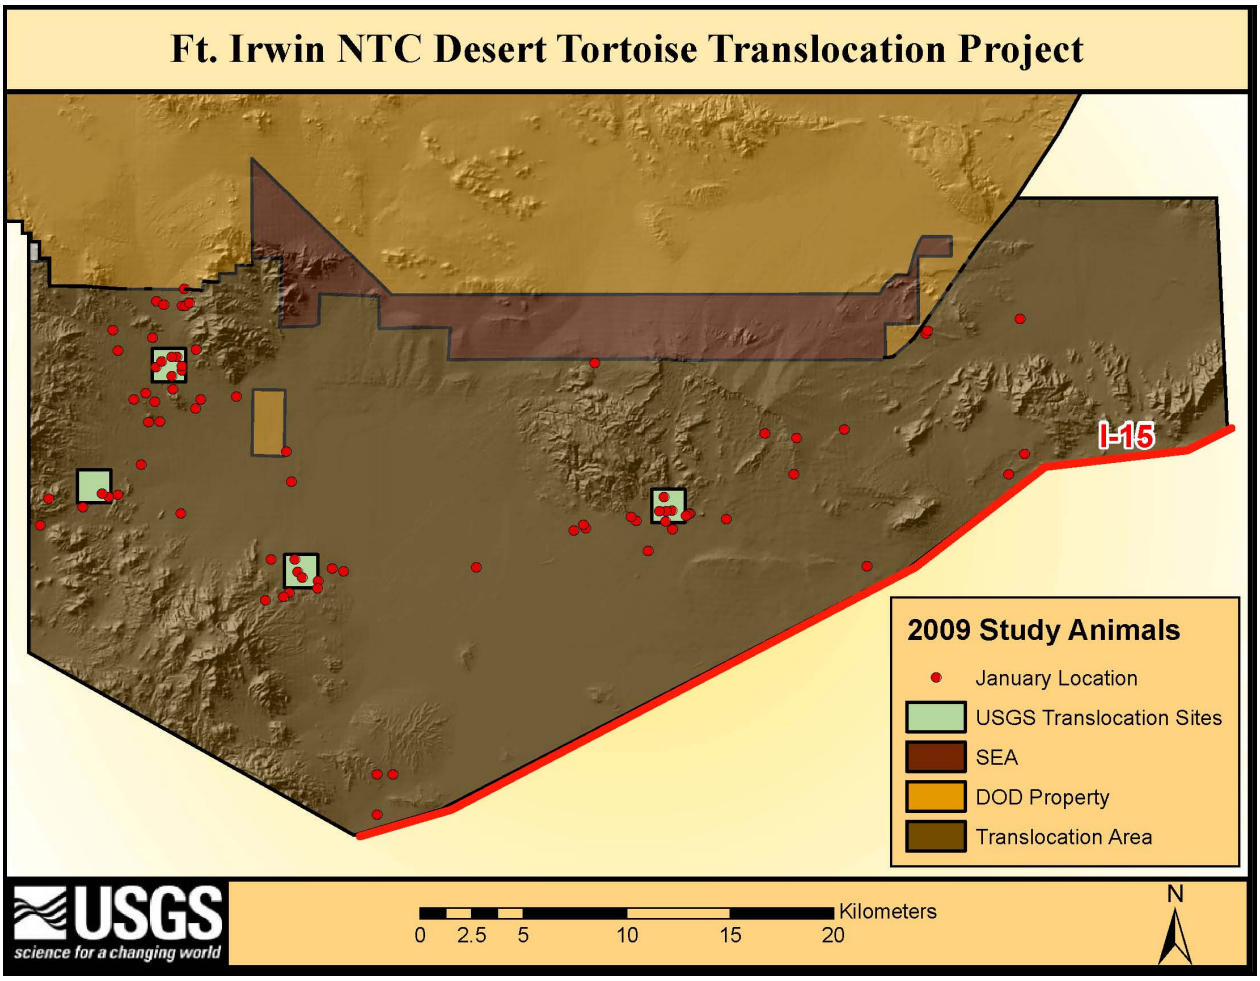

Figure 4. Map of USGS stress research tortoise populations in January 2009.

analyses in this report will use population designations as of January unless otherwise noted. In 2009, tortoises in our study ranged from 194 mm to 286 mm in carapace length.

Table 1. Number of tortoises utilized in each experimental population in January and November 2009.

	Populations in January 2009			Population in November 2009		
Sex	Control	Resident	Translocated	Control	Resident	Translocated
Female	3	14	9	1	14	2
Male	8	32	12	7	25	8
Total	**11**	**46**	**21**	**8**	**39**	**10**

Marking Desert Tortoises

In 2009, six new tortoises were found and added to the study. Based on their proximity to translocated tortoises, four of these were classified as control and two as residents. Floy® tags (in the FW-3500 to FW-3531 range) and transmitters were attached to all. An additional 23 transmitters were replaced throughout the year due to expected battery failure. A detailed list of transmitter serial numbers, frequencies, and associated tortoises is provided in Appendix 3.

Animal Movement

Each tortoise was tracked at least monthly in 2009, resulting in 2,461 observations between January 6, 2009 and November 5, 2009. To assist in understanding tortoise movement patterns, all observations from 2005-2009 (n=11,880) were incorporated into the analyses illustrating mean number of encounters (Table 2), or distances moved from original encounter site (Table 3,4). All locations associated with deceased tortoises were excluded from analysis. Some dead tortoises were located distances greater than 1 km away from the last known location and we suspect but cannot be certain that predators or scavengers may have relocated the carcass.

Table 2. Mean number of location observations for Resident, Control and Translocated desert tortoises each year.

Year	Resident & Control	Translocated
2005	7.97	7.48
2006	8.76	8.71
2007	7.92	8.84
2008	8.96	56.13
2009	32.67	27.86

Movement patterns were analyzed for experimental populations by calculating the mean Start To End Distance (Table 3), the Maximum Annual Distance (Table 4), and mean home-ranges using a kernel utilization distribution (Tables 5). Prior to translocation Start To End distances for male tortoises were significantly higher than female tortoises ($F_{1,514}=64.84$, $p<0.05$). In 2008 (the first year after translocation), no differences were observed between male and female tortoises ($F_{1,68}=3.7$, $p=0.06$) however, Start To End distances were observed to increase within the translocation treatment in comparison with resident and controls ($F_{2,67}=19.1$, $p<0.001$). During the following year (2009), males moved more than females ($F_{1,53}=4.1$, $p<0.05$), but no difference was observed among treatment groups ($F_{2,52}=0.4$, $p=0.7$). Analyses of Maximum Annual Distance' movements revealed that differences were not observed between male and female tortoises in 2008 ($F_{1,69}=0.2$, $p=0.65$) and 2009 ($F_{1,53}=3.2$, $p=0.08$). However, translocated tortoises had greater maximum annual distance movements compared to that of resident and control tortoises ($F_{2,68}=18.4$, $p<0.001$). Differences among treatment groups were not observed in 2009 ($F_{2,52}=0.4$, $p=0.64$).

Blood Sample Collection

Monthly blood samples were collected from April 6, 2009 through October 6, 2009. A total of 419 blood samples were collected via subcarapacial venipuncture (Table 6). In 2009, attempts were made to sample each individual monthly from April through October (Table 7). A detailed list of collected blood samples and associated tortoises is provided in Appendix 4.

Plasma Analysis

Laboratory analyses to measure plasma total corticosterone (CORT) were completed for most blood samples (n=2,180) collected throughout the tenure of this project (2005-2009). We analyzed CORT values with respect to venipuncture sampling technique, tortoise sex, lymph presence in sample, number of needle insertions required to collect sample, tortoise handling time in minutes, time of sample procession in minutes, month, year, tortoise activity, tortoise microhabitat location, ambient air temperature, habitat type, treatment group, and animal movement patterns (home-range size). Analyses for additional parameters potentially influencing

CORT (e.g. winter precipitation, annual forage, perennial cover) are still ongoing. The data were analyzed using a weighted linear mixed-effect model allowing weighting for the inverse quantity of lymph present in each sample such that samples noted to contain higher lymph contents had reduced influence in the analysis. As reported in Drake et al. 2007, samples collected from the jugular vein in 2005 resulted in higher CORT levels, and increased handling time and animal manipulation. As a result, all samples collected from the jugular vein in 2005 are considered elevated and therefore incomparable and were excluded from further analysis.

In 2006-2009, CORT values collected via subcarapacial venipuncture in female desert tortoises ranged from 0.15 to 33.63 ng/ml, and male values ranged from 0.50 to 41.20 ng/ml. Mean values in males (6.39 ± 0.14 SE) were higher ($F_{1,1717}=3200.6, p<0.01$) than mean values measured in females (5.31 ± 0.15 SE; Figures 5-7). Season variation in CORT was observed for both male and female desert tortoises (Figures 5-7). Female CORT levels tended to increase in late spring (May) coinciding with the period in which egg production typically occurs (Figure 7; Lance et al. 2001). Male CORT levels tended to increase at the end of summer (August) coinciding with known changes in behavior (increase in mating and antagonistic behavior) as well as physiological reproductive changes (e.g. spermatogenesis, Lance et al. 2001). Annual variations were also observed for CORT values; 2007 (year of low annual forage and annual rainfall) was significantly lower than other years compared to 2008 (year of higher annual forage and rainfall) which was higher than other years.

The model explaining the most variation among all those tested included sex and the year in which CORT samples were collected while accounting for and weighting by the amount of lymph present in the samples (model 1; Table 8, 9). None of the other covariates and factors of interest contributed toward explaining the variation in CORT that we observed. AIC_C increased by more than 200 points with the inclusion of: the number of needle insertions required to collect sample; tortoise handling time in minutes; sample processing time in minutes; ambient air temperature; tortoise activity; tortoise location; and general habitat category.

To evaluate any potential interaction between stress and animal movement, specifically home-range size, mean CORT values were calculated for each animal each year (2006-2009). Model selection yielded a model where CORT levels were best explained by tortoise sex and the year in which the samples were collected (Model 1, 2; Table 10, 11). Home-range size did not contribute significantly to the model (e.g. there was an increase in AICc over the best model by >20 points on inclusion of home range as a factor).

To evaluate any potential influence of translocation on stress in desert tortoises, mean CORT values were calculated for each animal for each year before and after translocation (2007 and 2008, respectively). Model selection yielded a model where CORT levels were best explained by tortoise sex and the year in which the samples were collected (Model 1,2; Table 12,13). Neither home-range size nor experimental treatment group (Resident, Control, and Translocated; Figure 8,10) provided a significant contribution to the model (e.g. there was an increase in AICc over the best model by >16 points on inclusion of those factors; Figure 11).

To more closely evaluate any the potential influence of translocation as this was the primary variable of interest to our study, we analyzed several variables of potential influence for 2008 and 2009 (both samples years post translocation). Model selection resulted in a model where CORT levels after translocation were best explained by the relative amount of lymph in the

sample and the year in which the samples were collected (Model 1; Table 14,15). Neither month nor experimental treatment group (Resident, Control, and Translocated) provided a significant contribution to the model (e.g. there was an increase in AICc over the best model by >9 points on inclusion), indicating that translocation had no statistical differences in the measured physiological effect on stress values (as measured by CORT) in desert tortoises (Figures 8, 9, 11). Mean CORT values in 2008 did not vary between treatment group (Figure 11). However, in 2009 CORT values for translocated tortoises were significantly lower than resident or control tortoises, and this difference is the opposite direction to our hypotheses, and is likely a statistical artifact due to drastically reduced sample sizes resulting from predation events (Esque et al. *In Review*) that may have isolated some of the sample groups into different habitat areas.

Vegetation Sampling

In 2009, transects (n=110) were sampled to estimate annual plant production throughout the study area. Sampling occurred for twenty quadrats (1 m^2) at random distances along each transect length for a total of 2,200 quadrats. The estimated mean annual plant production in 2009 was 16.4 g/m^2 ± 5.4 SE, the highest level of plant production in four years of sampling (Figure 13). Winter rainfall (October–February) was closer to the 100 year historical average (81.79 mm) and may have contributed to the increased production measured in 2009 (NOAA 2008, Table 16).

Table 16. Annual plant production in g/m^2 ± SE for four years of sampling. Annual plant production was not recorded in 2006.

Year	Plant Production (g/m^2)	SE	# Transects	Winter Precipitation (mm)
2005	1.96	0.6	89	132.08
2006				41.91
2007	1.71	1.84	30	21.08
2008	11.46	4.67	99	57.40
2009	16.4	5.38	110	58.17

Tortoise Mortality

In 2009, tortoise mortality rates were lower than the previous year (Appendix 6). In 2009, 32 tortoises were found dead (6 control, 15 resident, 11 translocated), compared to 59 in 2008(Table 17). Although fifteen of the deaths had evidence of canid presence (eg. scat, hair, burrow excavations, etc.), in most cases it was impossible to determine whether the death was due to a canid attack or if scavenging took place after a death by natural or other causes. Using a 3-sample test for equality of proportions, the number of tortoises found dead within each experimental population was not statistically different ($X^2=3.79$, $df=2$, $p=0.15$).

Table 17. Number of tortoises found dead in 2008 and 2009 throughout the Fort Irwin Study Area.

Year	Dead	Evidence of Canid Presence	Total Population in Study
2008	59	42	126
2009	32	15	86

DISCUSSION AND RECOMMENDATIONS

Discussion

The major focus of our research during 2005 was to track, locate and mark as many resident and control tortoises as possible, while simultaneously collecting information on their ecology, physiology, habitat use, and habitat condition. Because we were able to mark a robust sample size of animals in 2005, our research focus in 2006 was to acquire blood samples, as well as locating and monitoring of all tortoises. In 2007-2009, we streamlined our efforts to include a more intensive sampling effort each month to collect blood for tortoises within the three

experimental popuations throughout the active season (April to October). Efforts were made to capture and sample each animal during optimal temperatures and periods of expected activity throughout the day. As a result of this combined effort, we encountered, weighed, and measured 338 tortoises and attached transmitters to 241 tortoises throughout the study area. On March 27, 2008, we translocated 38 study animals located in the SEA into four selected release sites within the translocation area.

To evaluate potential physiological effects (e.g. increased stress) of translocation on desert tortoise populations, we evaluated adrenal glucocortoicoids, specifically corticosterone (CORT) for three years prior and two years after translocation. Blood samples were collected from 240 tortoises for a total of 2,183 samples over the past five years to determine physiological stress with each treatment group (resident, control, and translocated). Repeated measurements of individuals are vitally important to understanding individual responses to translocation. Repeated measurements on animals make it possible to detect changes in the status of tortoises relative to stress, site fidelity, movements, disease, and a number of other factors while accounting for the predicted changes of endocrine levels and associated parameters.

Glucocorticoids are a class of steroid hormones released from the adrenal glands in reptiles during a wide variety of stress stimuli and conditions, including harsh weather, animal manipulation (Romero and Wikelski 2001), and disturbances in habitat (Moore et al. 2003). These steroid hormones have been shown to elevate in chelonians during both acute and chronic stress events (Valverde et al. 1999); making it a good biomarker for assessing changes in physiological condition such as increased stress. We hypothesized that translocation of wild tortoises may cause a potentially chronic physiological stress response in both resident and translocated animals and this response may result in changes in behavior, habitat use, and movement patterns. Previous translocation studies have documented equivalent reproductive effort (Nussear 2004) and survivorship (Field et al. 2007) between residents and translocated tortoises; however, this is the first attempt to quantify physiological changes relative to translocation for desert tortoise populations.

Our analysis of CORT revealed that samples collected via jugular venipuncture increased handling time and animal manipulation resulting in higher CORT values compared to samples collected via subcarapacial venipuncture (Drake et al. 2007). Overall, CORT values collected using subcarapacial venipuncture for male tortoises were higher than values measured in females each month throughout the period of activity (April-October). Elevated levels of CORT in reptiles are believed to be associated with increased metabolism and increased activity or exposures to external noxious stimuli. Our results demonstrate that seasonal and annual variations in CORT occur for both male and female desert tortoises. Each year, we observed an increase in female CORT in late spring (May) coinciding with ovulation, egg production, and nesting as previously reported in Lance et al. 2001. In most years, male CORT increased at the end of summer (August and September) coinciding with known changes in behavior (increased male-male combat and mating activity; Ruby and Niblick, 1994) as well as the time of year when testosterone is highest and spermatogenesis is at a peak (Rostal et al. 1994, Lance et al. 2001).

After evaluation of possible influences on CORT (e.g. tortoise sex, lymph presence in sample, number of needle insertions required to collect sample, tortoise activity, habitat type, treatment group, etc.) variations in CORT values were best explained by tortoise sex and year in which in the sample was collected while accounting for and weighting by the amount of lymph present in

the sample. Annual variations in CORT values for both male and female tortoises suggest that environmental factors (e.g. rainfall, plant production) or behavioral changes (e.g. increased male-male combat, movement, or mating) may be influencing CORT. CORT values in 2007 (a year of low annual forage and annual rainfall) were significantly lower than other years; conversely in 2008 (a year of higher annual forage and rainfall) CORT values were significantly higher than other years. During periods of inadequate rainfall, low food production may result in tortoises reducing their energetic expenditure by spending less time of the surface, and searching for food and/or males. Hence, we would expect to observe lower stress values during this period of reduced activity. Conversely, when rainfall and food is abundant, tortoises will spend more time on the surface foraging, mating, and fighting which may result in an increase in CORT.

To evaluate the potential influence of translocation on stress patterns in desert tortoises, we examined CORT values for each treatment group (resident, control, and translocated) both before and after translocation and concluded that neither home-range size or treatment group significantly contribute to the variation in stress patterns. To more closely evaluate any potential influence of translocation as this was the primary variable of interest to our study, we analyzed potential variables of influence for 2008 and 2009 (years after translocation). We concluded that after translocation, differences in CORT were not observed among treatment groups, indicating that translocation did not cause a measurable physiological stress response within the first year of translocation. However, in 2009 CORT values for translocated tortoises were lower than resident or control tortoises, which was inconsistent with our *a priori* predications. However, the outcome is likely a statistical artifact due to drastically reduced sample sizes resulting from predation events (Esque et al. *In Review*) that may have isolated some of the sample groups into different habitat areas. Analyses for additional parameters (e.g. winter precipitation, annual forage, perennial cover, and elevation) potentially influencing these annual fluctuations in CORT are still ongoing.

As reported in Drake et al. 2009, tortoise mortality increased starting in January 2008 resulting in suspected deaths from canid species (coyotes and/or wild dogs). Tortoise mortality decreased from 59 tortoises in 2008 to 32 tortoises in 2009. While ravens are a common cause of juvenile predation amongst desert tortoises (Bjurlin and Bissonette 2004), no tortoise deaths were attributed to ravens. The lack of raven attack is likely due to the absence of juvenile tortoises in our study group. It is inherently difficult to determine the cause of death of desert tortoises, as most predator species of the desert tortoise are also scavengers. It was noted that with the increase in tortoise deaths, incidence of predator sign (e.g. scat, hair, tracks, burrow excavations, etc.) also increased. Also, many of the tortoise carcasses were disarticulated or had signs of canid tooth marks on the shell and radio transmitter (Figure 12).

With three years of below average rainfall (NOAA 2006, 2007, 2008), an increase in predation may have resulted from changes in environmental conditions influenced by drought. Periods of drought may indirectly increase mortality through increased predation on adult tortoises as the result of a functional response (prey switching) of predators to a decrease in prey availability (Woodbury and Hardy, 1948; Peterson, 1994). Small mammals such as lagomorphs (Clark 1972, and Saethre 1994, 1995) and rodents, may be particularly vulnerable and are known to decrease to densities as low as 1/ha (Whitford 1976, Chew and Butterworth, 1964, Brown and Harney 1993; Esque et al. *In Review*), due to extensive drought conditions the previous year.

Figure 12. Tortoise mortality with canid presence discovered this year in the Translocation Area.

Expanded research on tortoise mortality in the Mojave Desert (Esque et al. *In Review*) indicated a landscape wide relationship between drought, anthropogenic impacts to habitat and predation levels for desert tortoise populations. Specifically, at Fort Irwin patterns of coyote kills were strongly associated with the size of nearby human populations and terrain features, with potential associations with distance to urbanization and the density of roads. There was no evidence that translocation influenced the high predation rates on tortoises at Fort Irwin (Esque et al. In Review).

In 2010, we plan to continue to monitor and collect blood from all study animals involved in our stress research. We plan to complete laboratory analysis for plasma total corticosterone and testosterone values for all samples, and investigate the potential for cascading impacts of stress on immune function and other physiological factors. We will continue habitat characterization (i.e., primary production, annual vegetation structure, etc.) so that differences in habitat among the translocation sites are well documented. Due to an increase in tortoise predation over the last two years, we plan to locate and incorporate additional tortoises into the study in spring 2010 to generate a robust sample size for each treatment group.

Recommendations

We recommend a standardized format for data submission (i.e., web portal for weekly or monthly data uploads) that would allow all participating researchers the ability to gain necessary project information quickly. Due to high levels of movements by translocated animals necessitated some of our “control” animals may be more appropriately classified as “resident” animals. To assist in analyzing data for movement patterns, stress levels, etc. between experimental populations, we need to access a comprehensive data set that includes all encounter information for each tortoise from all researchers.

To maximize productivity, we also recommend that the Army or management agencies elect a research coordinator with access to the master database to facilitate daily ground activities and disseminate pertinent information in a timely fashion.

ACKNOWLEDGEMENTS

This research would not have been possible without the help of the U.S. Geological Survey, U.S. Department of the Army-Ft. Irwin, U.S. Fish and Wildlife Service, California Department of Fish and Game and the Bureau of Land Management. Our thanks are extended to our collaborators Richard Tracy, Ken Hunter, Amy Barber, and Salley DuPre. We would also like to thank Clarence Everly, Mickey Quillman, Andrew Walde, Peter Woodman, William Boarman, Kat Darst, Roy Averill-Murray, Becky Jones, and Charles Sullivan, for providing project guidance and expertise to the research design and data collection, and Julie Yee for her statistical support and expertise. We thank our field staff assistants: Richard Inman, Bryant Reynolds, Martin Kang, Alison Terry, Claire Phillips, Robert Kunicki, Felicia Chen, Justin Jay, Angela Klapperich, Chris Standley and Andrew Jones for their hard work and assistance throughout this project. In addition, we would like to thank the following Student Conservation Association volunteers: Pat Babbin, Fahimeh Baziari, Tim Barwise, Felicia Chen, Jackie Dearborn, Julia DeFranco, Adrienne DeSmet, Andrea Drager, Erin Driver, Ignacio Flores, Emily Frankel, Ryan Hess, Gloria Howerton, Maria Immel, Emily Jeffreys, Nicole Labutong, Alex Lewis, Emily Loew, Dean Posposil, Megan Ring and Emma Stewart.

Desert Tortoises Surveys and Research in the Southern and Western Expansion Areas of Fort Irwin 2008 Summary Report

by

Andrew D. Walde, A. Peter Woodman, William I. Boarman

ITS Corporation a QinetiQ North America Company

29 January 2008

Introduction

The expansion of the National Training Center, Fort Irwin California was approved on 21 December 2000 when President Clinton signed legislation. Charis Corporation (subsequently acquired by ITS Corp. which was subsequently acquired by QinetiQ Corp.) was tasked to estimate numbers of desert tortoises (*Gopherus agassizii*) on two of the three expansion areas: the Southern Expansion Area (SEA) and the Western Expansion Area (WEA), the latter formerly referred to as the Superior Valley Parcel. Dr. Alice Karl conducted the surveys for Charis Corp. (Karl 2001 and 2002) and the results indicated that a range of 1152 – 1223 desert tortoises likely occurred in the SEA and WEA combined. Karl's estimates were used to develop the Biological Opinion (BO, USFWS 2004) and the Desert Tortoise Translocation Plan (USGS 2005).

As part of the permitting process Fort Irwin agreed to translocate all tortoises found in the SEA and conduct studies to assess the effects on the translocated tortoises, the recipient population, and control population. Based on habitat and land ownership, U.S. Geological Survey (USGS) selected 12 translocation sites south and west of Fort Irwin on which to place tortoises found in the SEA. Three groups were selected to conduct research for the Fort Irwin translocation: USGS-Henderson is assessing the effects of translocation on stress levels, USGS-Moreno Valley is looking at health effects, and ITS is studying other issues related to translocation. Fort Irwin also agreed to translocate all tortoises found in the WEA, but did not need to conduct research on the success of the translocation.

In October 2006, ITS Corp was contracted by the US Army to initiate clearance surveys on the SEA. Clearance surveys on the SEA were completed in Fall 2007 by ITS. In addition to the ITS effort, USGS conducted clearance surveys in Fall 2005 on 10 sq. km when testing the efficacy of dogs versus people at finding desert tortoises. Approximately 550 immature and adult desert tortoises were fitted with radio-transmitters during the ITS and USGS clearance surveys. As much as possible, each tortoise was relocated monthly as required by the BO and Translocation Plan. An additional ~90 juvenile desert tortoises were translocated from the field to the Fort Irwin Study Site (FISS) to await translocation to the translocation area.

In early 2008, ITS was contracted by the US Army to translocate all tortoises on the SEA, propose and conduct research to study effect(s) of translocation on the translocated tortoises, a control population, and recipient population for four years. Funding limitations narrowed the proposed research down to three main research questions: movement, reproduction, and habitat use. In spring 2008, ITS Corp. was also selected to conduct clearance surveys in the WEA.

Methodology

Translocation

Translocation of the desert tortoises involved four steps: preparation, collection, transportation, and release. Preparation involved the task of selecting the location and treatment (if any) of each released tortoise. Release types included: going to one of four research translocation sites, one of three non-research translocation sites, or carried over the fence and then released under a shrub (hard release) or at an artificially constructed burrow (soft release), or in an enclosed pen. The four research sites were labeled 6, 10, 13, and Short Distance. Five-hectare pens were constructed near each of three sites: 6, 10, and 13. The pens were round and the fence was one by two inch wire mesh fencing material. The bottom six inches was toed in to the pen, laid onto the ground and covered with dirt. Translocation occurred during the mornings of April 1 to 18, 2008. Paper and electronic data forms were completed during each step: collection, processing, and release.

Four collection sites were established in the SEA to process tortoises prior to translocation. Approximately five to seven personnel staffed each site. On a daily basis each site received a list of tortoises to be translocated. On the day before translocation fieldworkers would collect the tortoises from the field. At the processing center each tortoise was weighed, measured, health assessed, transmitter changed if necessary, and photographed. Each tortoise was presented with water for a minimum of 30 minutes, most much longer, and after soaking tortoises were removed from their bins and allowed to walk around, forage, and dry off. All tortoises were handled with a new pair of nitrile gloves. All equipment was sterilized in bleach after use with each tortoise. Each tortoise was then placed in a plastic Sterilite container for holding at the processing center and for translocation. If a tortoise voided or defecated in the

container, the animal was rinsed off and the container cleaned before the animal was returned. Each container was washed with bleach and thoroughly dried prior to reuse.

A Bell helicopter was used to transport tortoises from the collection point to the release site. Special metal bins were fabricated so the Sterilite containers fit snugly and would not move during the flight. The bins were attached to the helicopter skids. (for results-longest flight from the far east to Site 6 took 12 minutes).

Tortoises were transported from the landing zones to their actual release point by hand. Tortoises were released approximately 50 m apart, generally in a grid. All tortoises were released into the shade of a shrub or into an artificial burrow. Any tortoises that voided during transport were washed with water prior to release.

Dispersion

After translocation, all translocated, resident, and control tortoises at Sites 6, 10, 13, and Short Distance were relocated a minimum of once per day for the first week, three times per week for two weeks, and twice per week through December 1. After December 1, each tortoise was radio-tracked twice per month. In addition to this structured sampling, numerous tortoises were relocated once per day for several weeks due to the long distances they were traveling daily. At each encounter a paper and electronic data form were completed and data collected included: ID number, time, date, location, burrow number (if applicable), and activity. Each burrow used by a transmittered tortoise was numbered with a pre-stamped numbered tag. Information collected for each burrow included: burrow and tortoise ID number, date, time, length, width, height, exposure, and nearby shrub characteristics.

Reproduction

Each transmittered female tortoise at the four study sites was radiographed every fourteen days between mid-April and mid-July. All tortoises were radiographed within 25 meters of their location with a portable, battery-operated x-ray machine. Actual handling time for each tortoise was less than five minutes. A paper and electronic data form was completed for each encounter recording: Tortoise ID, date, time, and radiograph exposure settings.

Genetics

Samples of red blood cells were collected from almost 1000 desert tortoises to look at genetic variation throughout the SEA and translocation area. The samples were taken from blood collected by USGS-Moreno Valley for health assessments. Analysis was conducted by Dr. Rob Fleisher at the Smithsonian Institution.

Western Expansion Area

In May 2008, clearance surveys were conducted on approximately 20 km^2 in the eastern portion of the WEA. Transects were walked in a north-south direction spaced at 10 meter intervals. Each tortoise that was located was fitted with a Holohil RI-2B transmitter, assigned an identification number, weighed, measured, and health assessed. Paper and electronic data forms were completed and photographs taken. Each transmittered tortoise was relocated once per month.

In October 2008, ITS Corp. continued the clearance surveys for four days before receiving a cease and desist order from the Army. After the stop work order ITS was tasked to verify estimates of density determined by Dr. Alice Karl (2002) in the WEA. For this effort ITS

crews walked clearance surveys but did not process or place transmitters on tortoises that were located.

Results

This past year, 2008, was a very busy and productive year for the Fort Irwin Translocation Project. The year started with the decision to translocate all animals that had tested negative for or were not in the vicinity of a tortoise that tested positive for exposure to *Mycoplasma agassizii or M. testudinae* from the Southern Expansion Area (SEA).

Translocation

The ITS team began translocation from the SEA on 31 March 2008, and moved the last scheduled group of juvenile tortoises on 18 April 2008 (Table 1). Health results were received in early May and 9 additional juvenile animals that were being held at DPW Environmental office were transmittered and released 11 May 2008. All animals translocated to sites 7, 9, and "Fence" were released without transmitters and are not a part of the analysis.

Table 1. Sex/size and location of translocated animals from the SEA at Fort Irwin.

	Sex				
Translocation Site	Male	Female	Immature	Juvenile	Total
6	31	27	16	14	88
7	39				39
9	17		1		18
10	34	25	20	11	90
13	36	25	20	11	92
Fence*	21		2		23
Short Distance	12	10	3		25
Total	190	87	62	36	375

*Translocation Site "Fence" is when an animal was found within 100 meters of the southern boundary fence, it was picked up and moved 100 meters south of the fence.

Dispersion

The ITS team began the research portion of the project with the translocation. Many animals were moved that still needed to have additional health assessments conducted. At the time of translocation many animals of the SEA needed an additional health assessment but health assessments cannot be conducted until May 1. The results of the health assessments were needed by ITS to make decisions as to the future status of each tortoise; if they would remain as research animals or released without transmitters. The results of those health assessments were never received, therefore the ITS team ended up with many more animals than planned to be used in the translocation studies. However, this turned out to be a mixed blessing as there has been quite a bit of mortality, particularly at site 6. A decision was made during the early fall that the ITS team would just utilize all currently monitored animals for their research. As we come into the 2009 season we are currently tracking a well balanced research design with more animals than we had originally proposed to study (Table 2), hopefully this will help to compensate for future attrition of study animals.

Table 2. Total number of live translocated animals at each translocation site as of 1 January 2009 separated by size/sex and research group for the ITS research studies.

Translocation Site	Sex	Study Group			Total
		Control	Resident	Translocated	
6	Male	9	10	19	38
	Female	10	6	13	29
	Immature			9	9
	Juvenile			8	8
10	Male	17	6	21	44
	Female	9	15	25	50
	Immature			20	20
	Juvenile			5	5
13	Male	11	12	22	45
	Female	11	6	24	41
	Immature			19	19
	Juvenile			9	9
Short Distance	Male	12	19	12	43
	Female	7	11	8	26
	Immature		1	2	3
	Total	86	86	216	389

Dispersal distances were calculated for all animals that had complete data over the time period of early April through hibernation. The distance that was calculated is the straight linear distance between their early spring location (~1 April; controls and residents) or translocation release point and their final, winter, location (~15 November). Distances moved for each sex/size category separated by study site and experimental types are presented in Table 3. No data are presented for the animals released in the pens as their movements were restricted. As was expected, the translocated animals moved greater distances than the residents and controls. The most notable difference in the data is the animals released at the short distance translocation

plot have moved much smaller distances. The greatest straight line distance moved by any tortoise during this first year was 23 kilometers.

Table 3. Dispersal distances (straight line) moved by translocated, control, and resident tortoises separated by site and sex. All distances are in meters presented as mean (range).

Experimental Type	Sex	Release Site				
		6	10	13	Average	Short Distance
Hard Release	Male	3528 (84-11649)	2213 (229-7254)	2033 (204-7404)	2613 (84-11649)	619 (116-1473)
	Female	2163 (677-4758)	1611 (289-2931)	1041 (315-2227)	1512 (289-4758)	298 (73-589)
	Immature	1502 (53-9328)	2949 (71-9509)	1349 (58-8833)	2014 (53-9509)	
	Juvenile	140 (15-400)	796 (26-1799)	196 (28-1033)	320 (15-1799)	
Soft Release	Male	4040 (691-12614)	2890 (484-11288)	5640 (163-23002)	4190 (163-23002)	
	Female	2631 (1165-3590)	1217 (554-2297)	3077 (524-8979)	2289 (524-8979)	
Control	Male	1597 (86-5291)	505 (107-1145)	389 (24-808)	612 (24-1145)	337 (41-691)
	Female	195 (177-231)	246 (2-519)	285 (3-799)	251 (37-799)	117 (69-175)
Resident	Male	2757 (107-15239)	256 (98-374)	1281 (24-6850)	1423 (24-6850)	297 (3-654)
	Female	234 (179-320)	1551 (12-13301)	135 (27-313)	934 (27-313)	240 (11-925)

Reproduction

The original study plan included 138 females, however 6 were removed as 2 were salvaged, 1 was lost, and 3 died early on in the study. The study therefore consisted of 132

female tortoises; 36 controls, 38 residents, 42 free-roaming translocatees, and 16 penned translocatees. Each tortoise was x-rayed once every two weeks between mid April and late July. The first gravid females were observed on 19 April (n=2), but the majority of eggs began appearing in larger numbers after 5 May. Second clutches did not begin until the very end of May and first clutches were still being detected until mid to late June.

Tortoises in all study groups developed eggs and some tortoises even laid second and third clutches. There are several early trends, but the differences we found are not likely to be statistically significant. A greater proportion of short-distance (SD) translocatees had first clutches (89 % vs 79 % in the other three sites combined; Table 4). Sites were pretty similar, but more translocatees at site 6 laid no eggs than the other sites (40% vs. 12.5% in other three sites combined). Slightly more control females laid eggs than others (86% vs. 79% of the other three groups combined), but in the proportion of non-penned translocatees that were gravid was surprisingly similar to controls (86%) and residents (82%). Only 69% of penned translocated females developed eggs. Treatment may have had the greatest effect on 2nd clutches: only 6% of penned animals and 14% of non-penned translocatees laid 2nd clutches, whereas 37% of residents and 39% of controls laid 2nd clutches. Clutch sizes were similar for all groups at approximately 3.5 eggs/clutch. The largest clutches were by a resident (n=8) and a control (n=7).

Table 4. Percentage of desert tortoises that had 1 and 2 clutches at the different study sites separated out by research group. Data presented as % (# gravid/total #).

Clutch	Study group	Site 6	Site 10	Site 13	Short Distance	Total
1	Control	77.8 (7/9)	80.0 (8/10)	88.9 (8/9)	100 (8/8)	86.1 (31/36)
	Resident	70.0 (7/10)	75.0 (9/12)	80.0 (4/5)	100 (11/11)	81.6 (31/38)
	Penned	60.0 (3/5)	80.0 (4/5)	66.6 (4/6)	--	68.8 (11/16)
	Translocated	60.0 (6/10)	91.7 (11/12)	81.8 (9/11)	88.9 (8/9)	81.0 (34/42)
2	Control	33.3 (3/9)	30.0 (3/10)	55.6 (5/9)	37.5 (3/8)	38.9 (14/36)
	Resident	20 (2/10)	41.7 (5/12)	33.3 (2/6)	45.5 (5/11)	36.8 (14/38)
	Penned	0.0 (0/5)	20.0 (1/5)	0.0 (0/5)	--	6.3 (1/16)
	Translocated	0.0 (0/10)	16.7 (2/12)	27.3 (3/11)	11.1 (1/9)	14.3 (6/42)

Genetics

Genetic analyses will ultimately be used to evaluate family relationships between hatchlings and adults to determine if translocatees are mating with residents. In preparation for that, we are evaluating the genetic structure of the Fort Irwin tortoise population to determine the amount of variability and presence or absence of genetic subpopulations. Initial non-spatial and spatial analyses have been performed on almost 1000 samples from the SEA, WEA, and translocation area.

The non-spatial genetic analysis did not reveal any subpopulations within the dataset. This could be because there are no subpopulations, or because we lack the resolution to detect them.

The spatial genetic analysis has tentatively revealed 2 subpopulations: A and B. The analysis has not been fine-tuned yet, so it may change, but the preliminary results are presented in Figure 1. The "islands" of higher probability are mostly surrounded by areas with greater ambiguity but the Subpopulation A in the northwest bisects two adjacent Subpopulation B areas. There appears to be a fairly strong break near the middle of the SEA, roughly where Manix Trail enters the SEA (very close to coordinate 530000, 3890000). This map may change a bit – other analyses are ongoing, we just wanted to include here some of the patterns that arose during these initial analyses. The strong break may be an artifact of the settings used in the analysis; modifying these settings in a sensitivity analysis may actually reveal a continuum where individuals are related in an isolation-by-distance pattern (direct relationship between genetic and geographic distance whereby genetically similar individuals occur close together and genetically distant individuals are found far apart).

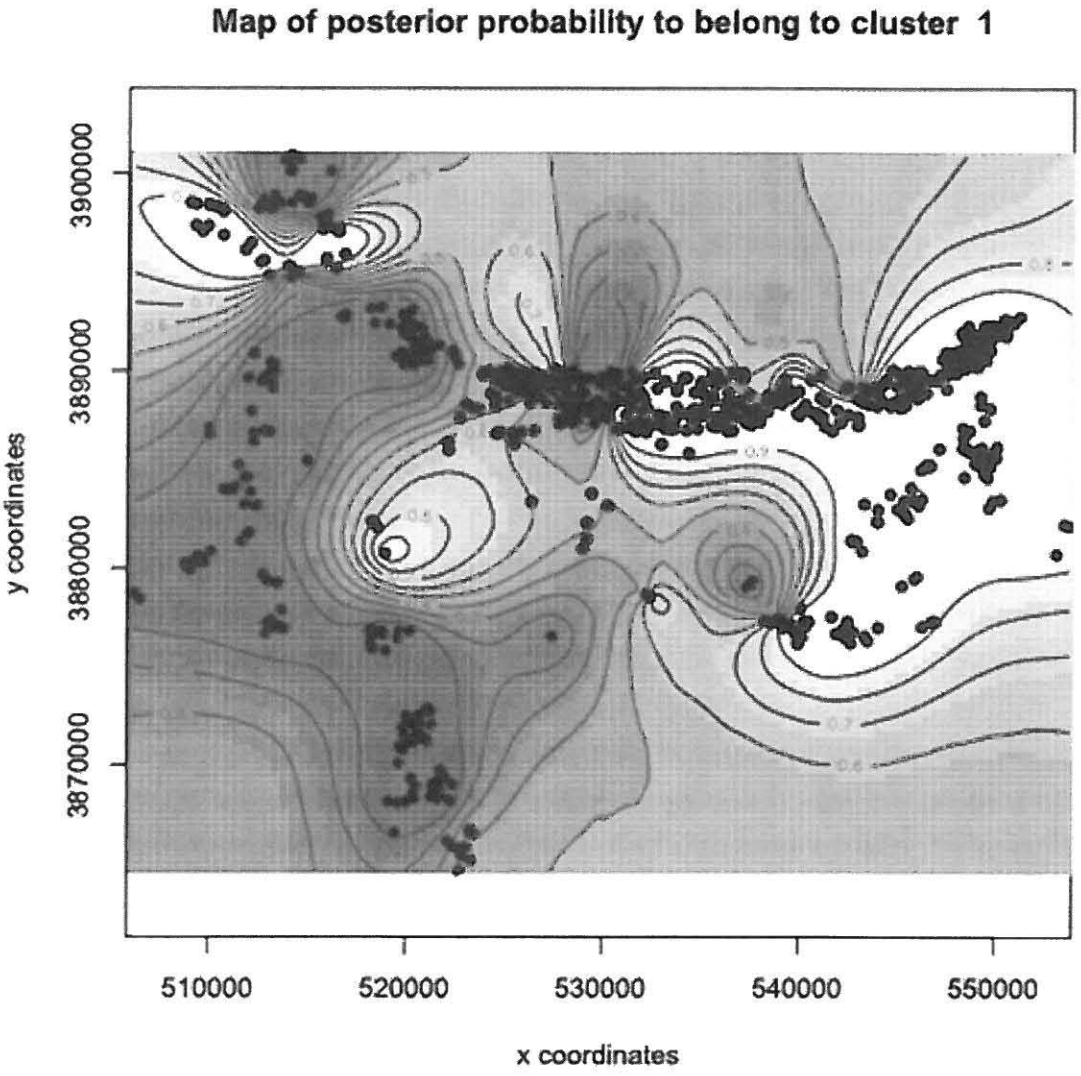

Figure 1. Map of spatial genetic analyses depicting the posterior probability of belonging to genetic cluster 1. Black dots are individually sampled desert tortoises. White indicates a high probability of belonging to Subpopulation A, red indicates a high probablity of belonging to Subpopulation B and the shading depicts varying grades of probablity of belonging to Subpopulations A or B.

Western Expansion Area

In May and October 2008, transmitters were placed on 80 desert tortoises in the WEA. Subsequently three of those tortoises have been found dead so 77 tortoises reside in the WEA with working transmitters. Four juveniles were located and transferred to FISS. Each of the WEA tortoises in the WEA are being tracked monthly. The data for the validation study have been presented in another separate report to the Army.

AVIAN MORTALITIES AT SOLAR FACILITIES

Amedee Brickey

April 14, 2014

Background

- CA/NV Desert – Few facilities prior to 2009
- Solar Development driven by:
  - Financing incentives (Grants, Loans Guarantee, Tax Breaks)
  - State RE Portfolio Standards

Background

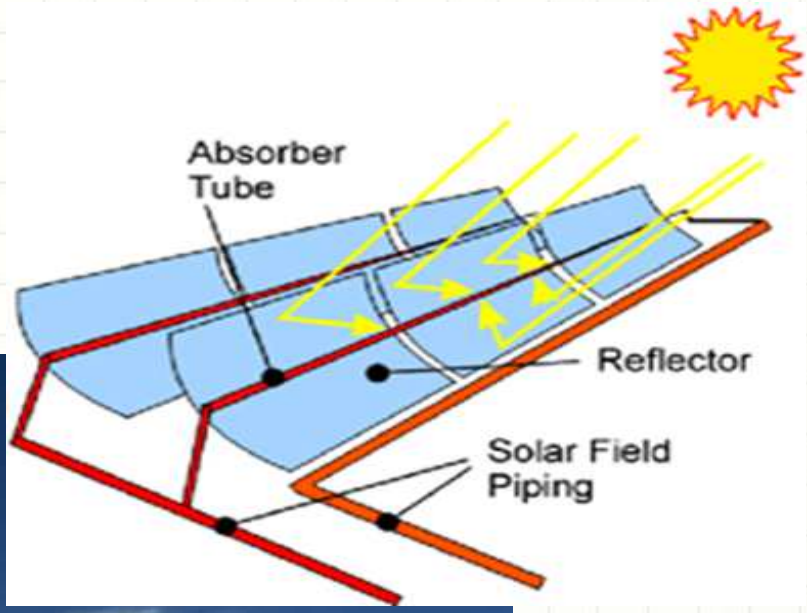
- Older Solar Facilities (prior to 2009)
  - Mostly on private land
  - No systematic mortality monitoring
  - No reporting requirements

California RE Action Team

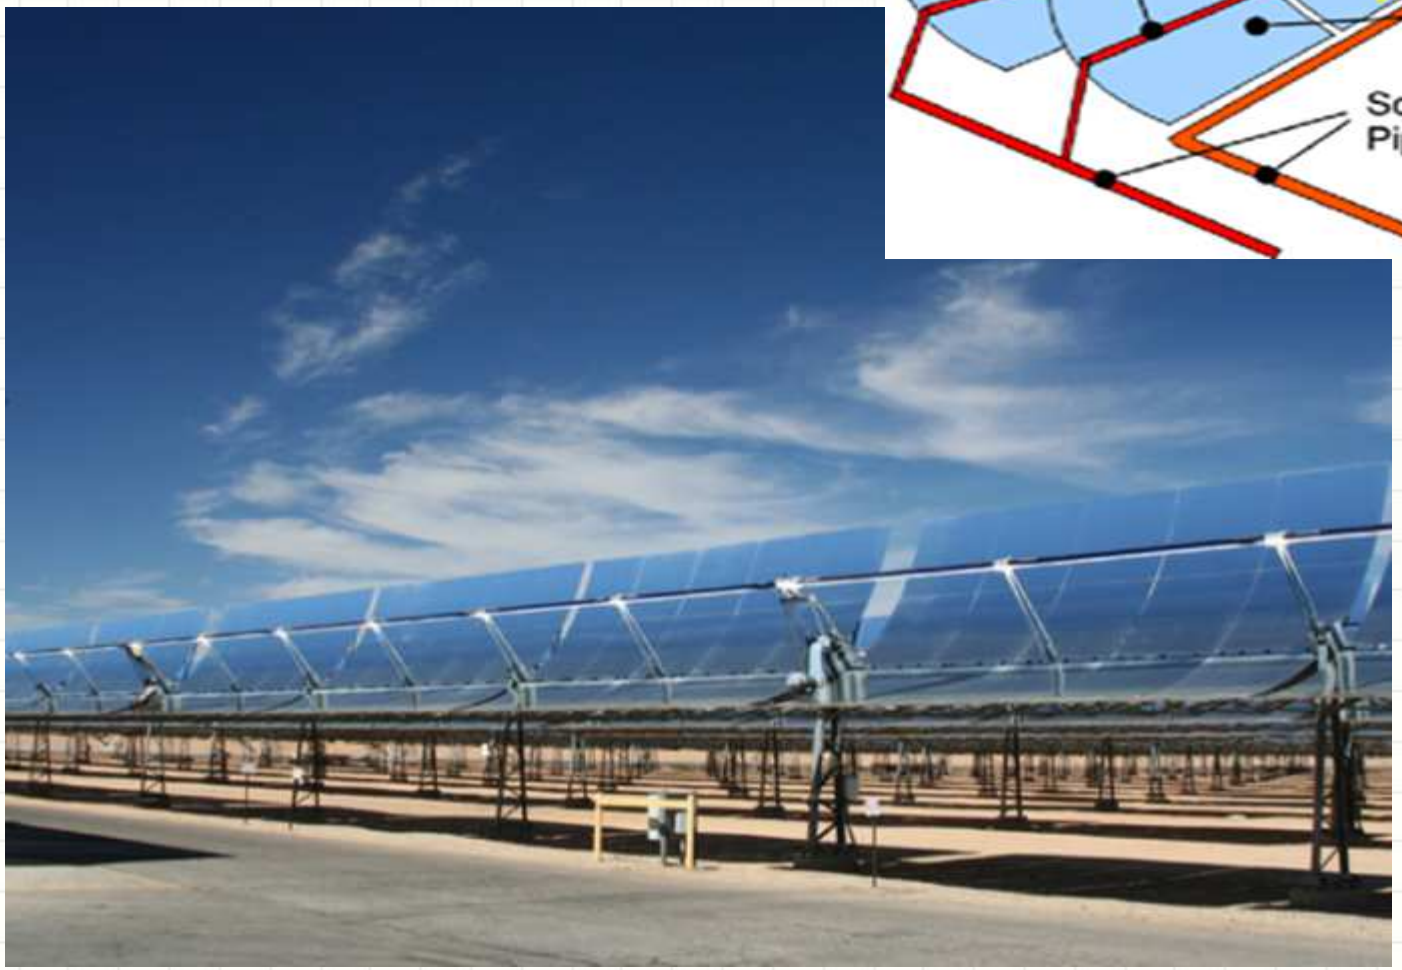
- Renewable Energy Action Team (REAT)
  - Established in 2009
  - Streamline agency review and permitting
- FWS worked with BLM and CEC
  - Require development of ABPP/BBCs
  - Agency review of documents

Project-level Avian Plans

- ABPP/BBCS include:
  - Measures to avoid take during construction
  - Systematic mortality monitoring
  - Reporting requirements
  - Some include adaptive management



Mortality Information



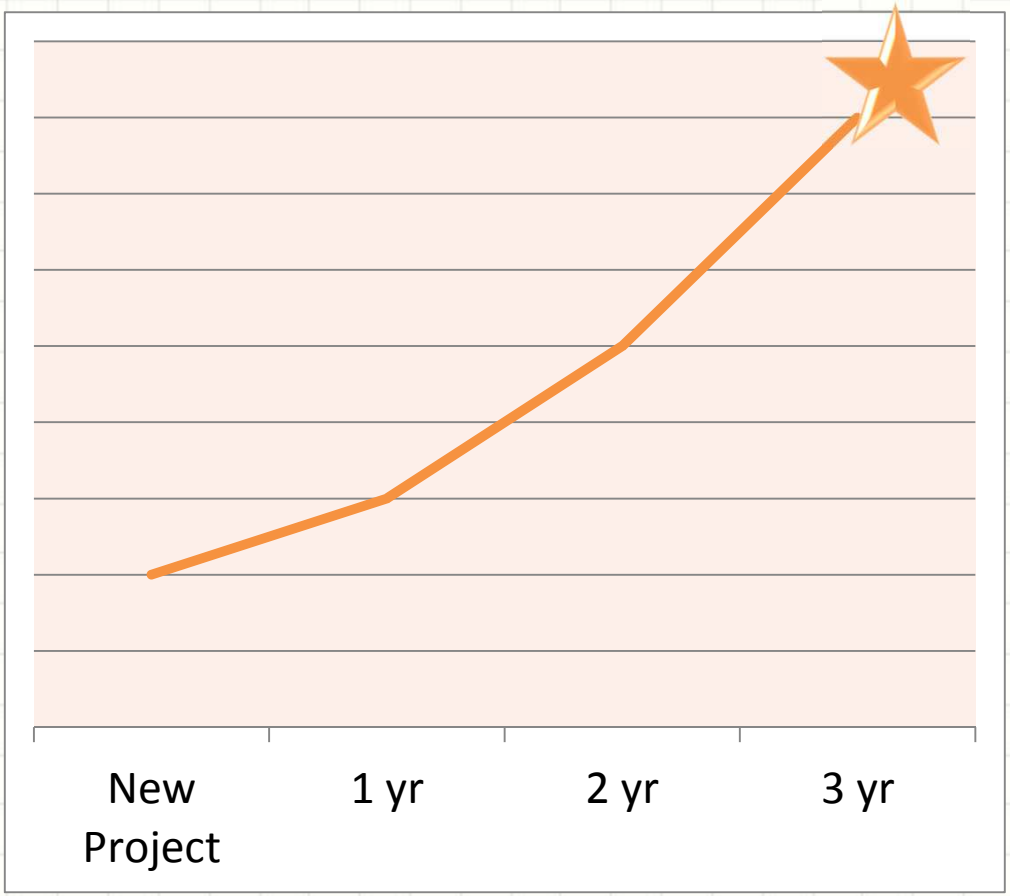
- Database created to track injury and mortality
- Collisions will panels and other project features
  - All 3 solar technology types
  - Wide range of avian species affected

Photovoltaic

Parabolic Trough

Power Tower

Concentrated Solar Flux Effects



- ISEGS fully operational for less than 6 months
- Incidental reporting (raptors, passerines, humming birds, butterflies, etc.)
- First quarterly report expected in May 2014

Concentrated Solar Flux Effects

Why - Cause and Effect

Our learning curve

It may take 2-3 years to answer some questions

Status

- Meetings with Solar Developers
  - September 2013
    - Discussed avian mortality concerns
  - February 2014
    - Discussed avian mortality data summary
    - Discussed research needs
    - Encouraged developers to get organized and help collect needed information to address avian collisions.

Summary

- Collaboration between industry and agencies will be needed to address the avian mortality issue.
- A framework that includes funding for research, adaptive management, and the eventual development of best management practices.
- Other stakeholders will need to be included.

QUESTIONS?

PROGRESS REPORT FOR 2010

Health Status of Selected Desert Tortoises (*Gopherus agassizii*) in Ft. Irwin's Southern and Western Expansion Areas in 2010 with Recommendations for Future Actions

January 5, 2011

Abstract. The 2010 data on health for five groups of desert tortoises in Ft. Irwin projects are summarized in this report: 1) 48 tortoises remaining within and near the confines of Ft. Irwin's boundaries in the Southern Expansion Area (SEA); 2) two tortoises in short distance research projects; 3) 12 tortoises living on or associated with Plots 6, 10, and 13; 4) eight resident stress tortoises; and 5) 52 tortoises resident in the Western Expansion Area (WEA). Most tortoises had not been previously evaluated for health. One hundred fourteen different tortoises were serologically tested for *Mycoplasma agassizii* and *M. testudineum* using ELISA tests. Two tortoises were seropositive for *M. testudineum*, one in the short distance research project and one on Plot 10. Three tortoises were suspect for *M. agassizii*; two were in the SEA and one was in the WEA. One tortoise in the WEA was suspect for *M. testudineum*. One unmarked resident tortoise was salvaged from the Irwin/Ft. Irwin road junction after being killed by a vehicle in 2009. Necropsy results indicated high levels of lead and the confirmed presence of herpesvirus. Three tortoises in the Western Expansion Translocation Area with potential health problems were re-evaluated in fall of 2010, and one was salvaged for necropsy. Recommendations are presented for disposition of tortoises currently remaining within or adjacent to the confines of Ft. Irwin's boundaries in the SEA.

INTRODUCTION

During 2010, the tasks for the U.S. Geological Survey's (USGS) health research team changed several times to meet requirements of various government agencies. The most critical task was to prepare tortoises remaining within the confines of Ft. Irwin's boundaries in the Southern Expansion Area (SEA) for translocation, first in fall of 2010, then, as plans changed, in spring of 2011. Another important task was to conduct health evaluations on research tortoises with no prior history of health evaluations, such as tortoises with previously existing radio transmitters in the Western Expansion Area (WEA); some tortoises on or associated with Plots 6, 10, and 13 and in the stress research program in the SEA; tortoises with previous moderate to severe clinical signs of upper respiratory tract disease (URTD) and/or suspect or positive ELISA tests for *Mycoplasma agassizii* or *M. testudineum* in the SEA; and tortoises with other moderate to severe clinical signs of disease in the SEA or Western Expansion Translocation Area (WETA). In addition, a continuing assignment was to report on tortoises salvaged because of death by road kill or ill health or other reasons.

For ease of reporting, this report is separated into six parts: 1) evaluation of tortoises remaining within the confines of Ft. Irwin's boundaries in the SEA; 2) tortoises in short distance research projects; 3) tortoises living on or associated with Plots 6, 10, and 13; 4) tortoises resident in the WEA; 5) eight resident stress tortoises; and 6) results for salvaged and necropsied tortoises.

METHODS

Desert tortoises previously had been fitted with radio transmitters by field workers from ITS/QinetiQ Corporation, the USGS stress research project, and USGS

health research project. The identification numbers, locations, frequencies of the radio transmitters, and other information were provided by ITS/QinetiQ Corporation and the Ft. Irwin office to the U.S. Geological Survey's Health/Research Team. Each tortoise was sought in spring and/or fall of 2010 and a health evaluation was conducted if the tortoise could be found. The health evaluations included unique identification number, size (carapace length at the mid-line in mm, MCL), weight, sex, posture, behavior, activity, recent trauma, and clinical signs of disease (e.g., URTD and cutaneous dyskeratosis) on the eyes, beak, nares, integument, and shell using a standardized seven-page form modified from an appendix in Berry and Christopher (2001). Digital photographs were taken of the eyes, beak, nares, plastron, carapace, and any unusual trauma or lesion.

During health evaluations, samples of blood were drawn primarily from the subcarapacial site, and if unsuccessful, by brachial venipuncture, using standard protocols (Hernandez-Divers et al. 2002, Berry et al. 2006). Samples of blood that were estimated to contain 10% or more of lymph were considered to be suboptimal because of the potential negative impact of dilution (e.g., Gottdenker and Jacobson 1995). Where possible, such samples were repeated with an objective of obtaining 90–100% blood with no lymph or only a trace of lymph (Berry et al. 2005). A nasal lavage was taken using standard protocols (Berry et al. 2006). All blood plasma (90–100% blood) and nasal samples were shipped to the Mycoplasma Laboratory at the University of Florida to determine the presence of antibodies to *Mycoplasma agassizii* or *M. testudineum* using enzyme-linked immunoassay (ELISA) tests developed to include multiple strains of each species (Schumacher et al. 1993; Brown et al. 1994, 2004; Wendland et al. 2007, 2010). The nasal samples were cultured, and when the test was positive, polymerase chain reaction (PCR) was used to amplify the *Mycoplasma* so that it could be identified to species (Brown et al. 2002). Samples retained at the USGS laboratory in Riverside include: red blood cells, lymph samples, and mixed plasma and lymph considered to be of poor quality. As part of the quality assurance and control protocols, the health evaluation data sheets and digital images were compared and changes were made to the data base where necessary.

In 2010 health evaluations were conducted between May 1 and 24 and between September 7 and October 10. Three databases were constructed for the potential SEA translocatees. One database contains the monthly monitoring data and has been included with excel files submitted to the permit holder, Clarence Everly, for the annual permit report to the U.S. Fish and Wildlife Service. The second database summarizes tissue samples obtained and includes data on type of samples obtained (blood plasma, plasma/lymph, and nasal lavage), date of collection, volume of samples, results of ELISA tests for *M. agassizii* and *M. testudineum*. The third database contains the health evaluation data sets and is undergoing quality control. This third database will also become part of the permanent database for the Ft. Irwin project but is not ready for archiving. The databases described above are provided separately to Clarence Everly, the permit holder, and are not included herein.

RESULTS, DISCUSSION, AND RECOMMENDATIONS

SEA Tortoises within or on the Boundaries of Ft. Irwin

Background

The Desert Tortoise Translocation Project at the National Training Center (NTC), Ft. Irwin, was initiated in 2005 in the SEA (Esque et al. 2005) with sampling of potential translocatees, resident tortoises, and control tortoises for health status. In spring of 2008, several hundred tortoises were translocated from within the boundaries of Ft. Irwin to study plots. After spring translocation in 2008, an estimated 96 tortoises still remained within Ft. Irwin boundaries and needed to be translocated, removed, or the disposition determined. Of the 96, 24 had received health evaluations in 2006 and 2007. The 96 tortoises had not been translocated for one or more reasons: 1) they were missing and could not be located; 2) the transmitters had become detached and the tortoises were lost; 3) the tortoises had tested suspect or positive with ELISA tests for either or both of the pathogens (*Mycoplasma agassizii*, *M. testudineum*) that cause URTD; 4) the tortoises had one or more moderate to severe clinical signs of URTD; and/or 5) the tortoises had not previously been evaluated for health status.

2010 Data

The objectives of the health research team for this part of the SEA were to provide sufficient information for determining if each tortoise was suitable for translocation in fall of 2010 or spring of 2011. Thus we conducted health evaluations in spring of 2010 on all tortoises remaining within Ft. Irwin boundaries that could be located, including recently discovered tortoises that had not received health evaluations. We also re-evaluated each tortoise with suspect or positive ELISA tests for *Mycoplasma* spp. and re-evaluated each tortoise with significant clinical signs of URTD. Several tortoises were missing (Table 1) and might still be alive and in the area. One tortoise, 4232, was missing and then located again in late October, too late for a health evaluation. Tortoise 4232 was the "fence gap" tortoise described in the previous year's report (Berry and Gowan 2010).

Forty-eight tortoises within the confines of Ft. Irwin or along the boundaries were evaluated for health (Table 2; Figures 1a, 1b). Two tortoises, 4066 and 4676, were ELISA suspect for *M. agassizii* in spring; tortoise 4066 was negative in fall and 4676 was not re-tested. No tortoises were ELISA suspect or positive for *M. testudineum*.

Health Status of Tortoises Monitored Regularly by the USGS Team

The USGS Health Team has attempted to monitor several tortoises on a regular basis since Fall of 2007. The current status is two dead, eight alive, and six missing (Table 3). In 2010, the Health Team continued to monitor eight tortoises (Table 1). One of these tortoises, 4232 has had a history of being intermittently missing. It was located in August and September 2009, disappeared again in October of 2009, was missing for most

of 2010, but was re-located in October of 2010 with a different radio frequency than on the official list. Five tortoises previously reported as missing include 4483, 4560, 4144, 4289, and 4616. An additional tortoise, 4525, has been missing since March 2010. The six missing tortoises and the one recently re-discovered tortoise were not evaluated in 2010.

The 2010 data on laboratory tests and clinical signs of disease are shown in Table 2 for seven of the eight live tortoises. Two tortoises (3111 [Plot 1.5/WEA] and 3405) are not of concern for translocation spring of 2011, because of their locations. None of the tortoises (in Table 2) sampled in 2010 had suspect or positive lab tests for mycoplasmosis. None of the SEA tortoises potentially scheduled for translocation in spring of 2011 had signs of a purulent nasal discharge or discharge typically associated with URTD.

General Findings about Health Evaluations of Tortoises in the SEA

Most tortoises that the USGS Health team has evaluated for the Ft. Irwin project since 2005 have had one or more clinical signs of URTD (mild edema of palpebrae, mild crusts on the palpebrae). These clinical signs have been mild and probably fall within normal limits of healthy tortoises. Of more interest and concern are tortoises with moderate to severe clinical signs of the ocular and nasal area. For the ocular area, these signs include mucoid drainage from the eyes (when dried, manifested as crusts), inflammation of the conjunctiva, eyes that are closed or nearly closed, and accompanied by other moderate to severe ocular signs. For the beak and nares, clinical signs of concern are those with moisture in or on the beak caused by drainage from the nares, discharge (especially purulent) from the nares, and nares occluded by a wet or dried discharge. Tortoises with signs of a nasal discharge are more likely to have mycoplasmosis, herpes virus infections, or another infectious disease than tortoises without these clinical signs. The probability of a tortoise have an infectious disease is less clear for moderate to severe ocular signs of disease.

Since a tortoise with mycoplasmosis may have a nasal discharge intermittently (Jacobson et al. 1995), we rely on such signs as occluded or partially occluded nares, embedded mucus and dirt on the beak and around the nares, and eroded nares with peeling scales. These clinical signs provide an indication of a nasal discharge. Several tortoises had partially occluded nares and embedded dirt and/or mucus on the beak and face. Interpretation of the cause(s) of the occluded nares was complicated in spring of 2010 by plant material from foraging. Many tortoises had green stains on the beak and remnants of sticky plant sap and plant parts on the beak. For some tortoises, the nares were partially occluded; the source of occlusion may have been plant sap or food but was not clear. When these tortoises were examined in later, in fall, they had no signs of purulent nasal discharges.

Recommendations for Tortoises Remaining Within the Confines of Ft. Irwin Boundaries

The following recommendations are for the disposition of tortoises, regardless of whether alive and locations are known or whether missing. These recommendations are made with caveats: each tortoise should be examined for clinical signs of health and disease prior to translocation in spring of 2011, a health form should be completed, and digital photographs should be taken. Special attention should be given to the presence of mold or fungus (because of wet soils and the wet winter), shell disease or other diseases of the integument, and signs of URTD. That status may have changed from 2010 to early 2011.

1. In the report for 2009 (Berry 2009), I noted that several SEA tortoises had not been sampled for health status since 2006 or 2007. This list has been updated with the 2010 data (Table 1). In addition to the tortoises listed in Table 1, the following are missing tortoises: 2006, 4012, 4352, 4394, 4395, 4397, 4406, 4437, 4600, 4670, and 4736. The missing tortoises listed in Table 1 and in this paragraph have not received a 2010 health evaluation. If they are found, they should be evaluated and tested before being translocated.

2. Tortoises 2519, 2244, and 3405 are often located outside the boundaries of Ft. Irwin (see Figure 1) and thus are not candidates for translocation based on location alone. In October 2009, tortoise 2244 had an unusual clinical sign during the health evaluation: a dried brown drainage from the left side of the mouth sufficient to stain the beak, mandible, and integument ventrally. In 2010, tortoise 2244 did not have the brown drainage; mild to moderate ocular signs of URTD were apparent, including a wet discharge from both eyes, mild to moderate edema of palpebrae and upper periocular area of both eyes, crusts on palpebrae and lower periocular areas, and significant closure of the left eye. No signs of a purulent discharge were apparent. The health status of this tortoise should continue to be monitored, and the oral cavity should be evaluated periodically for signs of herpesvirus lesions and plaques. In 2010, clinical signs of URTD for tortoise 3405 included crusts, edema, and wet discharge associated with both eyes. In 2010, clinical signs of URTD for tortoise 2519 included moderate edema associated with both eyes, but no other signs. These three tortoises were seronegative for *M. agassizii* and *M. testudineum.*

3. Tortoise 3111 is on the boundary of Plot 1.5 and the Western Expansion Area (WEA) and, in December 2009, was 100 m into the WEA. In 2010, this tortoise tested ELISA negative for *M. agassizii* and *M. testudineum.* However, it has three prior seasons of positive and suspect tests for *M. agassizii,* as well as some mild clinical signs of URTD (but no nasal discharge). It is not a suitable candidate for translocation, but will not be considered for translocation until the translocation of WEA tortoises occurs.

4. Tortoise 4232, should not be translocated in 2011 until it is evaluated for health. Tortoise 4232 was last evaluated for health in fall of 2008; it was missing in spring of 2009, found and monitored briefly during summer of 2009, and disappeared again prior to the fall health evaluation in 2009. Tortoise 4232 was missing for most of 2010, but has recently been located. The most recent health evaluation occurred in fall of 2008, at which time the tortoise had a wet glob (4 to 6 mm in diameter) of whitish-yellow mucus

on the gular horn, apparently from the nares. Other clinical signs of URTD were also present.

10. In 2010, tortoise 4676 had a suspect ELISA test for *M. agassizii* and a negative ELISA test for *M. testudineum*. This tortoise needs to be re-evaluated and re-tested prior to translocation.

11. Tortoises with moderate to severe clinical signs of disease and trauma may merit additional monitoring and tracking. The tortoises listed below are noted in Table 2 for continued monitoring and possible salvage:

a. trauma: 2453, 4066, 4088, 4256
b. clinical signs of URTD: 4374, 4748
c. severe lesions (disease) of integument: 4521

12. There still is confusion about which group is tracking which tortoise for some tortoises remaining within the boundaries of Ft. Irwin (Table 1 and 3). Fewer tortoises may be missing than those listed in Table 1 and in Recommendation 1 above. This topic is best resolved by Ft. Irwin personnel, working with the research teams.

Tortoises in the Short Distance Translocation Project

Two adult male tortoises, 2625 and 4759, were evaluated and tested in May of 2010 (Figure 2). Male 2625 had a high positive titer (≥256) for *M. testudineum* antibodies. Clinical signs of mycoplasmosis included: nares rimed with dried and moist discharge; potentially constricted nares; embedded dirt and/or plant material on the beak and around the nares; moderate swelling of the palpebrae; wet and watery globe; wet and dry ocular discharge; and moderate yellowish crusts on palpebrae and periocular areas. Both eyes were about 60% open. Based on the location and condition of this tortoise, it should be salvaged.

Although male 4759 had negative ELISA tests for mycoplasmosis, numerous clinical signs suggestive of disease were evident. The signs included a very dry appearing and flaky integument on the carapace and potential cutaneous dyskeratosis on parts of the forelegs; moderately occluded right nare and beak with embedded light-colored, powdery material; moderate edema of the upper periocular area and mild to moderate edema of the palpebrae; moderate to severe discharge, mucus, and crusts on the periocular area in the left eye and moderate in the right eye; moderate crusts on palpebrae; peeling scales on the periocular area; and conjunctiva 5% exposed on the left eye.

Recommendation:

Based on location and condition of tortoise 2625, it should be salvaged for necropsy.

Tortoises on Plots 6, 10, and 13 in the SEA

Identification numbers and locations of 12 male tortoises were provided for sampling in spring of 2010. Although other tortoises with radio transmitters were on these plots and the tortoises had not been evaluated for health previously, the ITS/Qinetique and USGS Stress research teams did not provide identities and locations because of the nature of the research programs and the desire that their tortoises not be handled by the Health Team.

With one exception, the 12 tortoises from Plots 6 (4 tortoises), 10 (6 tortoises), and 13 (2 tortoises) were evaluated in spring. The exception was tortoise 3184, which was evaluated in both spring and fall. Of the 12, one tortoise (3593) from Plot 10 was seropositive for *M. testudineum* (Fig. 2). All other tortoises were negative for both *M. agassizii* and *M. testudineum*. Tortoise 3593 has severe ocular signs of URTD, including the following: moderate edema of the upper palpebrae and severe edema of the lower palpebrae; mild to moderate edema of the periocular area; mild to moderate crusts, moisture, mucus, and discharge with moderate crusts on the lower periocular area; moderate to severe peeling of scales on the upper and lower periocular areas, especially of right eye; nares open and with signs of erosion and peeling scales, embedded material on beak; and eyes 30% open. This tortoise should be salvaged for necropsy. Other tortoises from Plot 10 also had similar ocular signs but not quite as numerous or severe as 3593. On Plot 13, tortoise 4080 also had numerous severe ocular signs (moderate to severe edema of palpebrae and periocular areas with discharge and crusts); the eyelids and periocular areas were so swollen that the eyes were 30% open. Tortoises on Plot 6 also had numerous ocular signs, but few of the severity observed on Plots 10 and 13. Some tortoises had evidence of cutaneous dyskeratosis on the forelegs and shell.

Recommendation:

Tortoise 3593 should be salvaged for necropsy.

USGS Stress Tortoises

The Health Team evaluated eight tortoises in the stress research program but did not have samples of plasma to send to the University of Florida for testing for *M. agassizii* and *M. testudineum*. All eight tortoises are located to the east northeast of the Minneola off ramp and are close to I-15 (Figure 2). All eight tortoises had one or more clinical signs of disease, particularly mild to severe ocular signs (mild to moderate edema of the palpebrae and periocular area accompanied by mild to moderate wet and dry crusts and discharge; peeling of scales from the periocular area; mild to moderate mucus on the globe, fornix or lids). Tortoise 3804 was of concern: dried blood was evident between scales of the left periocular area and on the forelimbs. The beaks of most tortoises were embedded with dirt and/or a combination of dirt and mucus. Nares were mildly occluded or with flaking skin or scales on a few. One nare of tortoise 3819 was >50% occluded with discolored brown material, potentially dried blood and mucus. Three tortoises (3800, 3806, 3819) had previous, partially healed damage to the gular horn and other areas from

gnawing and chewing by predators. Most tortoises had signs of cutaneous dyskeratosis with ringing of scales on the forelimbs.

Recommendation:

Plasma samples should be sent to the Mycoplasma Laboratory for ELISA testing.

WEA Tortoises

The Health Team evaluated 51 tortoises that had not been previously evaluated for health, and tortoise 3111 that has moved from SEA Plot 1.5 in and out of the WEA (Figure 3). One female tortoise, 5130, was suspect for *M. testudineum* with the ELISA test. Another female tortoise, 5252, was suspect for *M. agassizii*. The rest of the tortoises had negative ELISA tests for both *M. testudineum* and *M. agassizii*. Female 5130 had moderate edema of the lower palpebrae and periocular areas of both eyes, moderate crusts, eyes that were partially open (10-15%) apparently due to edema, a yellowish dried discharge on lids and periocular area, and healed trauma from a predator attack to the gular and other parts of the carapace. Female 5252 had mild to moderate edema of the lower palpebrae and periocular areas with a moderate to severe drainage and mucus in the right eye; she also had evidence of active cutaneous dyskeratosis on the plastron.

WETA Tortoises

Three tortoises, first evaluated in fall 2009, were sought in fall of 2010. During a review of the health evaluations for WETA tortoises evaluated in 2009 (Berry et al. 2010), the Health Team identified three tortoises with clinical signs of sufficient interest and severity for follow-up visits. Although none of the tortoises had been fitted with radio transmitters, they were found quickly. The tortoises were female 7277 (eye lesion, possibly a periorbital abscess as per Dr. Elliott Jacobson), young male 7279 (ocular signs), and female 7280 (peeling and shedding carapacial scutes). For female 7277, clinical signs evident in fall of 2009 were no longer present in October of 2010; she had mild to moderate edema of the palpebrae and periocular area, mild crusts, and dried discharge with mildly peeling scales of the periocular area of the left eye. No action was taken on this tortoise. Male 7279 may have a problem with the right eye, holds the head to the right, and appears to use the left eye for observation. Both eyes have moderate edema of the lower palpebrae and exposed conjunctiva (40% in the right eye, 10% in the left). The conjunctiva in the right eye appeared abnormal, did not change position, and appeared to be thick and fleshy with an uneven and textured surface. The right eye was 40% closed. The tortoise had recent chewing injuries to the plastron. No action was taken on male 7279. Tortoise 7280 had areas with detached and loose scutes on the carapace. In the year since the tortoise was first evaluated for health in fall of 2009, more scutes had become detached. By fall of 2010, >50% of the vertebral and costal scutes had been shed or were loose. This tortoise was salvaged for necropsy (see below).

Necropsies

A report is now available for two tortoises salvaged for necropsy in fall of 2009: a road kill from Ft. Irwin, and a Daggett tortoise in the epidemiology program (Jacobson and Berry 2010). The report was submitted to Clarence Everly in December 2010. The former tortoise (road kill) is of importance for future planning. This large adult male tortoise was salvaged during death from the junction of the Irwin and the Ft. Irwin roads. Notable findings were the high content of lead in scute, bone, and other organs. DNA extracted from a swab specimen of the tongue was tested by PCR for presence of herpesvirus using primers that amplify sequences of the herpesvirus genome. The amplification product was homologous to a herpesvirus previously reported in a captive desert tortoise, thus confirming the first evidence of herpesvirus DNA in a free-ranging tortoise. Christopher et al. (2003) reported that ill wild tortoises from the eastern Mojave Desert were observed to have oral lesions typical of herpesvirus, but confirmatory testing was not conducted at that time. This new finding is very important.

Results of laboratory and toxicology testing and histology are not yet available for tortoise 7280, which was salvaged in October 2010. The gross necropsy indicated that the tortoise was moderately anemic, had a small liver and a nodule in the liver. The amount of fat was good.

Recommendation:

The Health Team recommends that swabs of the tongue of desert tortoises should be routinely collected and tested by PCR for herpesvirus infection. There are numerous cases where this recommendation should be applied, including translocation projects.

Acknowledgements: Dr. Mary Brown and Dr. Lori Wendland of the University of Florida are collaborators on this project. They provided valuable advice on interpretations and will be co-authors on any future publications for the open literature. Dr. Elliott Jacobson, also of the University of Florida at Gainesville, is the pathologist. For tracking, monitoring, and conducting health evaluations of tortoises, we thank Tim Gowan, Nate Newman, Marcella Waggoner, Ashley Emerson, Kemp Anderson, Kevin Lucas, Rafe McGuire, Sally Boisvert, Cynthia Furman, Tonya Rasmussen, Trevor Ose, Sara Hanner, John Boswell, Ben Kirkpatrick, Chris Hatton, John Hillman, and Brenda Hanley. Todd Esque coordinated fieldwork with USGS scientists at the Las Vegas Field Station. Thanks are due to S. Jones for review and to C. Everly for assistance advice. The National Training Center, Ft. Irwin, provided financial support.

Table 2. Clinical signs of disease for tortoises within and adjacent to the National Training Center (NTC) boundaries of Ft. Irwin in 2010. The table includes tortoises 2519, 3405, and 3111 which were outside the boundaries of the NTC. Tortoise 3111 was within the WEA during 2010, but frequently can be found on Plot 1.5 in the SEA. Tortoise 4232 was missing throughout most of 2010 and was located too late in the year to sample.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
35 M Ad		14-May-10	neg/neg	Nares open; staining of integument around nares from food, soil or other. Both eyes: mild/moderate edema of palpebrae and mild/moderate crusts on palpebrae and periocular area; moderate wet and dry mucus; peeling of scales in periocular area. Conjuctiva exposed ~5% in R eye. Ringing of scales on forelegs.
2244 M Ad	USGS-health	18-May-10	neg/neg	White rime or embedded white material within and on edges of nares (not occluding nares). Both eyes: mild/moderate edema of palpebrae; wet and dry mucus and discharge with moderate crusts on lids and periocular area; L eye 30% closed and with eye appearing sunken. A very dirty face. Ringing of scales on forelegs.
2519 M Ad		15-May-10	neg/neg	R and L nares mildly occluded (white deposits and possibly flakes of skin) and area around nares with white deposits, embedded in integument; mild/mod edema of palpebrae and mild edema of periocular area, discoloration of scales on upper periocular area; mucus (mild) in fornix of R eye. White deposits at fornix of both eyes. Sclera inflamed in L eye. Active CD on forelegs.
2543 M Ad		15-May-10	neg/neg	Mod edema of palpebrae both eyes; mild/mod crusts on lids and periocular area, both eyes; dried ocular discharge (white deposits); several mm mucus on L eye near fornix; Conjunctiva 25% exposed in R eye, R eye 50% open. Dirt and/or plant sap on beak with white deposits embedded near and around nares. SEVERE TRAUMA (not healed) in limited area of humeral and pleural scute junction: necrotic tissue? **Should track and monitor, at minimum.**
2543 M Ad		8-Sep-10	neg/neg	Some staining on forelegs from eye/chin/wipes. Nares open, R eye with mild edema of palpebrae, mild wet and cry crusts and discharge on palpebrae and lower periocular area, and 5-10% conjunctiva exposed. L eye: mild edema of palpebrae, mild crusts on palpebrae and lower periocular area (wet and dry). Peeling of scales on upper periocular area of both eyes. SEVERE TRAUMA (not healed) in limited area of humeral and pleural scute junction: necrotic tissue? K **Berry wants to track after translocated.**

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution.

Table 2, continued.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
2570 M Ad		14-May-10	neg/neg	Nares mildly occluded with dirt/plant sap/deposits; erosion between nares. Mild edema of L palpebrae and mild/mod edema of R palpebrae and upper periocular area; mild peeling of scales on periocular area; 5% of conjuctiva exposed. Deposits embedded in integument of beak. Cutaneous dyskeratosis on plastron and forelegs.
3111 M Ad	USGS/Health; WEA/SEA	3-May-10	neg/neg	Nares mildly occluded with plant sap. Mild edema and crusts on upper and lower palpebrae and perioculars of both eyes. Eyes have wet discharge and conjunctiva is visible in both. Cutaneous dyskeratosis on plastron and forelegs. Severe old healed trauma to gular, humeral scutes and four marginal scutes.
3186 M Ad		8-Sep-10	neg/neg	R nare mildly, partially occluded with whitish staining surrounding nares. Both eyes: mild edema of palpebrae with crusts and discharge (mild) and peeling scales on periocular area. Conjunctiva 5% exposed, eyes 5% closed. Healing trauma to scales of R foreleg. Mild cutaneous dyskeratosis at midline of plastron; scales of forelegs ringed.
3405 M Ad	USGS-health	17-May-10	neg/neg	Mild discoloration, edema and crusts on upper and lower palpebrae and perioculars of both eyes. Dried discharge from both eyes. Beak and nares have dried white exudate. Cutaneous dyskeratosis on plastron and forelegs. Healed trauma to gular, some old healed chips on carapace, and a few damaged scales on limbs.
4003 M Ad		17-May-10	neg/neg	Beak and face very dirty with plant sap and deposits; nares mildly occluded (cobwebs, whitish deposits) and some erosion. Moderate to severe discharge from eyes; R eye with mild/mod edema of palpebrae, crusts moderate on periocular area; mild peeling of scales on periocular area. Conjunctiva exposed 25% on R eye and 15% on L eye. L eye 80% closed.
4066 M Subad		18-May-10	suspect/neg	Nares mildly occluded with plant sap/dirt/mucus (?). Beak dirty from foraging; embedded material in integument. Moderate edema of left palpebrae and periocular area; R eye inflamed and may have lesions on the sclera or mucus bubbles, appears cloudy; mild to moderate edema of R palpebra and upper periocular area. Previously attacked by carnivore (chewed gular, ant. carapace, ant plastron) but not healed. Integument on forelegs shows moderate signs of cutaneous dyskeratosis. RETEST. Don't translocate.

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution. 17

Table 2, continued.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
4066 M Subad		9-Sep-10	neg/neg	Nares open, normal. Both eyes: palpebrae and periocular area mildly discolored from peeling scales and crusts; mild edema, wet and dried crusts, and discharge associated with globe and palpebrae; conjunctiva 5% exposed. Tortoise healing from multiple old wounds of predator attack, **potential areas of blacked or dark necrotic tissue. Size and previous trauma are likely to make this tortoise less likely to survive translocation.**
4071 imm		16-May-10	neg/neg	Nares moderately occluded with combination of dirt/cobwebs/plant sap and potentially mucus. Thick layer/lip of plant material on beak. Mod edema of palpebrae and none to mild of periocular area; mod crusting on palpebrae and periocular area with deposits. Ocular discharge with mucus in L eye. Eyes 80% open. Conjunctiva 5% exposed in L eye. Rapidly growing young tortoise with evidence of CD on forelegs.
4088 F Ad		17-May-10	neg/neg	Clean nares. L eye; mod to severe edema of palpebrae, also mod edema of upper periocular area, eye 80% closed due to edema; mucus in fornix. R eye: mod edema of palpebrae, eye 30% closed. Both eyes: mod peeling of scales on periocular area. **Trauma on gular, potentially necrotic areas.**
4100 M Ad		17-May-10	neg/neg	**L nare mildly occluded with unknown material.** Mild deposits on beak, face. Mod edema of palpebrae, mod edema of upper periocular area; mild crusts on palpebrae, mod on periocular area, peeling of scales on periocular area. Mild drainage from L eye. Conjunctiva exposed 10% of R eye and 5% on L eye.
4100 M Ad		9-Sep-10	neg/neg	Faint foraging stains; mil dirt on beak and R nare. Mild edema and crusts on palpebrae of both eyes; mild edema of lower periocular area and mild/mod crusts of periocular area of both eyes; mildly peeling scales of upper periocular of both eyes. Eyes 5% closed, conjunctiva 15% exposed. Mild healed trauma to limbs, gular, and plastron.
4145 F Ad		19-May-10	neg/neg	L nare mod occluded with dirt or other materials; white deposits embedded in integument around nares. Both eyes have mild crusts and mild/mod peeling scales on periocular area. Conjunctiva exposed 5% on R eye. L eye open 15-20%. CD on forelegs.
4145 F Ad		10-Sep-10	vial cracked; sample lost	Mild swelling of chin glands. Mild greenish stains on beak; mild discoloration of lower palpebra R eye and palpebrae of L eye. Mild/mod edema of palpebrae and periocular area of both eyes; peeling scales (mild) on periocular area of both eyes. Eyes 15% closed. Mild to moderate trauma (healed) on limbs gular horn, carapace and plastron. Cutaneous dyskeratosis on forelegs.

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution.

Table 2, continued.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
4147 F Ad		19-May-10	neg/neg	Nares open, mild, limited white deposits embedded in integument on beak. Mild/mod edema of palpebrae; mod discharge from both eyes; severe wet and dry crusts of mucus and dirt on palpebrae and extending onto periocular area; mild peeling of scales on periocular area of both eyes; mucus present in both eyes.
4181 M Ad		15-May-10	neg/neg	Nares open, scales peeling and eroding ventrally; beak dirty. L eye: mild edema of lower palpebra, dried mucus on both lids, conjunctiva exposed 5%, peeling of scales on lower periocular area. R eye: mod. edema of lower palpebrae, wet/dry mucus on lids, conjunctiva exposed 15%, eye wet with drainage onto lower periocular area and lids, peeling scales on both upper and lower periocular area; eye 25% closed due to edema. Severe lesions on plastron (pleural and abdominal scutes).
4190 imm		19-May-10	neg/neg	Nares open; scales peeling and cracking around nares; beak and area around nares and mouth are dirty with dried and embedded materials. Mild to mod. edema of palpebrae and upper periocular area of both eyes, also lower periocular area of L eye, mod. peeling of periocular area; Wet/dried mucus and crusts present in fornix and on lids. Young and rapidly growing tortoise.
4191 M Ad		18-May-10	neg/neg	Nares open, beak embedded with dirt; face very dirty; thick white deposits. R and L eyes: mild/mod edema of palpebrae, mild edema of upper periocular area; mild/mod crusts and sand on palpebrae with mucus in fornix of L eye and in posterior part of R eye. Mild peeling of scales on periocular area. Conjunctiva exposed 10% on R eye and 15% on L eye.
4201 unk		13-May-10	neg/neg	Nares open, beak dirty with scales peeling around nares; face dirty but not severely so. L eye: mild to mod edema of palpebrae; both eyes have mild wet and dry crusts and peeling scales on periocular area. CD on forelegs; a growing juvenile.
4214 M Ad		13-May-10	neg/neg	Face moderately to severely dirty with plant sap/dirt and possible mucus; nares open, beige/sandy rime or deposits adjacent. Both eyes: mild to mod edema of palpebrae and mild edema of lower periocular area. Mild crusts on palpebrae and periocular area with moderate peeling of scales. Conjunctiva exposed 5% in both eyes.
4217 M Ad	USGS Health	10-Aug-10	ng/neg	Beak: dried dark colored stains on beak; palpebrae and periocular area mildly discovered, mild edema of palpebrae in R eye and L lower palpebrae, crusts on R upper palpebrae and L periocular area; mildly peeling scales in periocular area with mildly sunken eyes. Cutaneous dyskeratosis (mild) on forelimbs, carapace and plastron.
4231 M Ad		24-May-10	neg/neg	Nares open with peeling scales adjacent. Very dirty, matted face with embedded dirt, plant matter, and white deposits. L and R eyes: mild edema of lower palpebrae and periocular area, peeling scales on upper and lower periocular area, mild mucus (wet/dried) on palpebrae and globe; conjunctiva 10% exposed in L eye and 20% in R eye.

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution.

Table 2.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
4232 M Ad	USGS Health?		no data	Found in October--transmitter changed (no health evaluation done)
4256 M Ad		16-May-10	neg/neg	Nares occluded partially or with combination of distorted openings; beak very dirty with embedded dirt and/or plant matter and/or mucus. R and L eyes: mod. edema of palpebrae, mild edema of upper periocular area; mucus in fornix, conjunctiva exposed 10% in L eye, 5% in R eye; mild peeling of scales on upper and lower periocular area. Severe past trauma to R posterior carapace; vehicle hit/crushing.
4256 M Ad		9-Sep-10	neg/neg	Mild swelling of both chin glands, mild drainage of R gland. R and L eyes: mild. edema of palpebrae and periocular area (mod to lower R periocular area); mild crusts on lower palpebra and periocular of R eye upper palpebrae and periocular area of L eye; dried discharge both eyes. Conjunctiva exposed 15% in both eyes, R eye 5% closed, L eye 15% closed; plant material in L fornix. Severe past trauma to R posterior carapace; vehicle hit/crushing. **When translocated, K Berry wants to track and monitor.**
4259 M Ad		10-Sep-10	neg/neg	Chin glands mildly swollen and draining; mild normal green foraging stains on beak. Eyes with mild discoloration and edema of palpebrae (both eyes) and mild edema of upper periocular area. Mild to moderate crusts present on lower palpebrae and periocular area of both eyes. Eyes 5% closed and conjunctiva 5% exposed. Mild trauma to limbs, gular, and carapace.
4374 M Ad		13-May-10	neg/neg	**R nare open, L nare possibly 80% occluded**; very dirty face and beak embedded with dirt. Mod edema of palpebrae, mod wet and dry crusts with wet mucus, mild ocular discharge; peeling of lower periocular area.
4374 M Ad		8-Sep-10	neg/neg	Foraging stains on beak; nares with dried whitish material and white material embedded in integument of beak. Mild edema of R palpebrae and periocular area and discharge at fornix, with damp crusts. Mild/mod edema of L palpebrae and periocular area with mild crusts and wet discharge at fornix; eyes 15% closed. Old trauma to L foreleg. Mod/severe cutaneous dyskeratosis on plastron and moderate and active on forelegs.
4387 M Ad		13-May-10	neg/neg	Nares open, scales peeling around nares; moderately to severely dirty beak. Mild edema of R and L palpebrae with mod wet and dry mucus and crusts on palpebrae and periocular area; wet ocular discharge; peeling scales on lower periocular area. Conjunctiva exposed in both eyes.
4396 M Ad		14-May-10	neg/neg	Nares open and rimed with whitish deposits and possibly mucus. Dirty beak. Mild/mod edema of palpebrae and periocular area; mild/mod crusts on both eyes; wet and dried mucus discharge at fornix of both eyes; peeling scales in periocular area. Large sand grains on lower lid and fornix of L eye. Conjunctiva exposed 10% and 5% in R and L eyes, respectively. Cutaneous dyskeratosis on forelegs, mild on plastron.

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution.

Table 2, continued.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
4404 F Ad		14-May-10	neg/neg	Nares open, rimed with white deposits, scales peeling adjacent. Dirt on beak. Very mild edema of palpebrae; mild/mod wet and dry crusts and mucus; mild peeling of scales from periocular area. Conjunctiva exposed 5% in both eyes. Cutaneous dyskeratosis on forelegs. Yound, rapidly growing tortoise.
4438 F Sad		16-May-10	neg/neg	Nares open, rimed with white deposits; compared to other tortoises in spring, face relatively clean. Both eyes: very mild edema of palpebrae, trace of mucus on globe and dried on palpebrae. Conjunctiva exposed 5% in R eye. Cutaneous dyskeratosis on forelegs, young tortoise.
4521 M Ad		16-May-10	neg/neg	Material (unknown) partially occluding R nare; both nares with erosion, dirt, plant sap/mucus on beak. R and L eyes: upper periocular partially covers over and obscures upper palpebrae. Mild crusts on palpebrae; mild peeling scales on periocular area; both eyes may be mildly sunken. Eating Eriogonum! **POTENTIAL SALVAGE:** Large patches of scales have peeled away from forelegs.
4604 F Ad		20-May-10	neg/neg	Nares open, white deposits on scales of beak. Mild dirt on beak. Mild to moderate edema of palpebrae; fine power or sand and crusts present on palpebrae of both eyes. Scales peeling on periocular area. R eye: mucus and/or lesions on globe, conjunctiva 10% exposed.
4617 imm		14-May-10	neg/neg	Nares open with peeling and cracking of adjacent scales, also white deposits on beak. Mild edema of palpebrae with mild mucus (wet and dried). Dried mucus near L fornix; peeling scales on periocular area. Cutaneous dyskeratosis on forelegs. Young, growing juvenile.
4625 F Ad		12-May-10	neg/neg	Nares open, scales peeling adjacent, embedded white deposits in beak. Mild edema and mild wet/dry mucus and crusts on palpebrae and periocular area. Conjunctiva 10-15% exposed both eyes.
4626 F Ad		12-May-10	neg/neg	Nares open, peeling scales adjacent; dirty beak. Both eyes: mild/mod edema and wet/dry mucus crusts on palpebrae, peeling scales on periocular area; mild ocular discharge. Conjunctiva exposed 2% in R eye.
4642 M Ad		12-May-10	neg/neg	Mild dried white dry rime present in both nares (**field workers report exudate, I don't see it in photo)**, with potential erosion of nares or peeling of scales; matted and embedded material adhering to exudate or plant sap on beak. Mild/moderate edema and wet/dry crusts on palpebrae and periocular area; peeling scales on periocular area. Conjunctiva exposed 5% L eye.

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution.

Table 2, continued.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
4642 M Ad		7-Sep-10	neg/neg	Mild dried white dry rime present in both nares, with potential erosion of nares. R eye: mild edema of lower palpebra, mild crusts on palpebrae and periocular area; peeling scales on upper periocular area; conjunctiva 10% exposed. L eye: mod edema of palpebrae and mild edema of periocular area, crusts on lower periocular area with mildly peeling scales on upper periocular area; mucus present, conjunctiva 5% exposed. Old trauma to L foreleg. Potential cutaneous dyskeratosis on integument of forelegs.
4646 M Ad		8-Sep-10	neg/neg	Chin glands mildly swollen, no drainage; evidence of foraging. Embedded white rime in nares and around scales on beak and mouth. R eye: mild edema of lower palpebra and periocular area, mild discharge and crusts (wet and dry) on palpebrae and lower periocular area; mucus in fornix; eye 20% closed. L eye: mild/mod edema of palpebrae and mild edema of periocular area; mild to moderate wet and dry crusts (mod on lower palpebrae; eye 40% closed. Left side of face with damp whitish . material posterior to mouth. Ringing of foreleg scales typical of cutaneous dyskeratosis.
4652 M Ad		19-May-10	neg/neg	Nares open, white rime, erosion and white deposits present; dirty beak and face. **Fieldworkers reported mild brown dried nasal exudate present (KB does not see this in digital photo).** Mild/mod edema of palpebrae, mild/mod edema of upper periocular areamild to moderate wet and dry crusts on palpebrae; eyes mildly recessed with dirt in fornix.
4653 M Ad		12-May-10	neg/neg	Nares open, some erosion, peeling of scales; dirty beak and face with dirt mixed with plant sap,possibly mucus, on and in nares. Mild to moderate edema and crusts on palpebrae and globe (moderate, L eye); peeling scales on periocular area.
4673 M Ad		12-May-10	neg/neg	**Nares open, eroded; moisture on integument above, below and to L side of naris and within entry.** Mild dirt on and in nares. Mild/moderate edema of palpebrae; mild/mod wet ocular discharge; mild wet/dry mucus and crusts on palpebrae; conjunctiva of both eyes 5% exposed; dirt in fornix of both eyes.
4673 M Ad		7-Sep-10	neg/neg	Chin glands mildly swollen, with mild clear drainage, both nares damp/moist on first observation, dried immediately; green foraging stains barely evident on beak. R eye with mild/mod edema and crusts on palpebrae; mild crusts on lower palpebrae, moderate wet to dry discharge, mucus in fornix, conjunctiva 10% exposed. L eye mild/mod edema and crusts with wet and dry discharge on palpebrae and lower periocular area. Upper periocular area with mild edema, conjunctiva 5% exposed. Scales peeling on periocular area of both eyes. Mild ringing of scales on forelegs, typical of cutaneous dyskeratosis.
4674 F Ad		12-May-10	neg/neg	Nares open; beak dirty with embedded plant sap, dirt and possibly mucus. Mild to moderate edema of palpebrae; mild edema of periocular area dried discharge at fornix and on palpebrae; mild peeling of scales in periocular area. Mucus in fornix of both eyes.

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution.

Table 2, continued.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
4676 M Ad		13-May-10	suspect/neg	Nares open with white, dried rime; very mild embedded material on beak. Mild edema of lower palpebrae; mod crusts from mucus on palpebrae; peeling scales on periocular area; conjunctiva exposed 10 and 5%, respectively.
4677 M Ad		14-May-10	neg/neg	Nares constricted and/or eroded and L mildly, partially occluded; some adjacent scales peeling. Beak with embedded dirt and/or plant matter/mucus. Mild to mod. edema of palpebrae, mild dried/wet mucus on lids, mild peeling of scales in the upper and lower periocular area, conjunctiva 5% exposed in R eye; nares constricted and/or eroded and partially occluded; beak with embedded dirt and/or plant matter.
4679 F Ad		13-May-10	neg/neg	Nares open, **R nare damp**, scales peeling. Moderately dirty beak. Mild to mod edema of lower palpebrae and periocular area, both eyes; mod/severe wet and dried mucus and crusts on palpebrae and periocular area; mod wet/dried discharge; mild peeling scales on periocular area. L eye mildly swollen; eyes 30% open.
4679 F Ad		8-Sep-10	neg/neg	Nares mildly occluded with white rime, white staining on beak around nares. R eye with mild edema of lower palpebrae, mild wet and dry crusts, moderate mucus in strings on globe and lids; L eye with mild wet and dry crusts and mucus strings on palpebrae. Both eyes have peeling scales in periocular area and are closed or partially so. Trauma (healing) to scales of R foreleg; R hind leg deformed and or repaired old damage.
4686 F SAd		19-May-10	neg/neg	Nares open, scales peeling; beak mildly dirty with embedded plant sap/dirt/mucus (?); mod edema of palpebrae and upper periocular area and with sand on lids; mod wet/dried mucus in eyes; scales peeling on periocular area; conjunctiva exposed 10 R eye and 5% L eye.
4699 M Ad		18-May-10	neg/neg	Nares open, scales peeling away, beak dirty from plant sap/dirt/mucus (?) combined. Both eyes bulging laterally, mod edema of palpebrae and lower periocular area; mod wet and dry crusts and mucus; scales peeling from periocular area; R eye 30% open, L eye 70% open. Mucus on globe.
4704 M Ad	USGS Health	13-May-10	neg/neg	Beak: dirt adhering to plant sap. Mild edema of upper R palpebra and periocular, L upper periocular; crusts (mild) in both eyes, mildly peeling scales in periocular area, conjunctiva 10% exposed, mild trauma (chewing) on post. R marginal scutes.
4734 F Ad		15-May-10	neg/neg	L nare mildly occluded; moderate dirt on/in beak and nares. Mild/ mod edema of palpebrae and periocular area; lids with sand and dried mucus/dirt; both eyes mildly bulging; eyes 70, 90% open; conjunctiva 10% exposed.
4748 M Ad		17-May-10	neg/neg	L and R nares mildly occluded, white rime evident, peeling scales; some embedded dirt/plant sap/mucus (?). Mild/moderate edema of palpebrae; **very severe yellowish crusts on periocular area** (especially R eye), crusts mild on palpebrae; mildly peeling scales on periocular area of both eyes. R eye 20% open. Mild white edges in seams between all scutes on plastron.

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution.

Table 2, continued.

Tort ID	Status & PI 2010	2010 Sample date ddmmmyyyy	2010 ELISA results: *Ma/Mt*	Clinical signs noted in 2010.
4748 M Ad		9-Sep-10	neg/neg	Nares appear to be mildly rimed with white and may have mildlly peeling scales at opening; beak with mild foraging stains. **Upper and lower palpebrae of both eyes discolored from yellowish wet to dry crusts and discharge (mild) on palpebrae and periocular area (mod/severe) of both eyes**. Mildly peeling scales on both eyes (periocular area); conjunctiva 5% explosed in both eyes. Eyes appear to be mildly sunken, possibly because crusts on periocular area area heavy. Plastron is peeling on humeral, pleural, and abdominal scutes, possibly from cutaneous dyskeratosis, old fungus, etc.
4749 F Ad		12-May-10	neg/neg	Nares open, scales potentially peeling adjacent; face very white/grey dirty with combination of plant sap, dirt, and possibly mucus. Large lower "lip" of plant sap on beak. Mild edema of palpebra; mod edema of periocular area; mild crusts (wet/dry) on palpebrae and periocular area; mild peeling of scales on periocular area. Conjunctiva exposed 10%
4999 M Ad		15-May-10	neg/neg	Nares open with mild, white rime; embedded dirt/sap/etc. on beak. Mild wet/dry mucus and dirt crusts on palpebrae and periocular area; moderate peeling of scales in periocular area. Conjunctiva exposed 5% in each eye.

Berry, K.H. 2011. Health status of selected desert tortoises in Ft. Irwin's Southern and Western Expansion Areas in 2010… This is a draft of the 2010 progress report, is under agency review, and is not for distribution.

Table 3. Summary of ELISA test results for *Mycoplasma agassizii* and *M. testudineum* of desert tortoises currently located in the Southern Expansion Area and currently monitored by the USGS Health team. Green cells represent negative status on ELISA tests, orange cells represent suspect status, and red cells represent positive test results

INTRODUCTION

The Clapper Rail (*Rallus longirostris*) is a marsh obligate species whose range includes saltwater marshland from New England south to Texas along the Atlantic coast and from San Francisco south to Baja California along the Pacific coast (Bent 1926). The Yuma Clapper Rail subspecies (*Rallus longirostris yumanensis*) is found in freshwater habitats along the Colorado River, associated drainages, and isolated regions of the Salton Sea, California (Phillips, et al. 1964, Alcorn 1988, Eddleman 1989). In addition, Yuma Clapper Rail are currently known to occupy areas along the Muddy and Virgin Rivers in southern Nevada (McKernan and Braden 1999, 2001a, 2001b, McKernan and Carter 2002, Rathbun and Braden 2003, Braden et al. 2005, Miller et al. 2006, Braden et al. 2007, 2008).

The breeding season for Clapper Rail extends from mid-March through August. Nests are placed on elevated ground within the marsh and are constructed of plant stems and grasses. The nests are concealed with live vegetation pulled over the nest to form a canopy. A clutch of 8 to 11 eggs is laid in the nest, but may occasionally be as few as 4 or as many as 14 eggs. Both male and female Clapper Rail incubate the eggs for 20 to 24 days. Both parents attend to the nestlings. Nestlings can swim within a day after hatching, are independent of parents in 35 to 42 days, and can fly by 63 to 70 days after hatching (Baicich and Harrison 1997).

Yellow-billed Cuckoo (*Coccyzus americanus*) are found in stream-side willow and alder groves, open woodlands, parklands, gardens and orchards from British Columbia east to Newfoundland and south into South America (Alcorn 1988, Baicich and Harrison 1997). The breeding range of the Yellow-billed Cuckoo in the United States includes isolated areas of Idaho, Utah, California, Arizona, southern Nevada, and throughout most of the continent east of the Rocky Mountains to the Atlantic coast (Mulroy 2002). The distribution of the western race of the Yellow-billed Cuckoo (*Coccyzus americanus occidentalis*) has contracted in recent years. The western race of Yellow-billed Cuckoo has been considered a rare and transient summer resident in Nevada where the breeding populations in the western and southern portion of the state are considered to be nearly extinct (Alcorn 1988).

The breeding season for the Yellow-billed Cuckoo extends from late May through early August. Nests are concealed in a bush or tree from 2 to 20 feet above the ground and are constructed of a variety of plant materials. A clutch of 3 to 4 eggs are laid in the nest, but may be as few as 1 or as many as 5 eggs. The female incubates the eggs for 9 to 11 days, with occasional help from the male. The nestlings are tended by both parents and can fly about 21 days after hatching (Baicich and Harrison 1997).

The Muddy and Virgin Rivers in southern Nevada both contain multiple and dynamic areas of suitable breeding habitat for both Yuma Clapper Rail and the Western Yellow-billed Cuckoo. This report details the continuation of focused Yuma Clapper Rail and Yellow-billed Cuckoo surveys by the San Bernardino County Museum conducted along the Virgin and Muddy Rivers in southern Nevada since 2000.

METHODS

Yuma Clapper Rail (YCRA) - Field surveys were conducted from March through June 2008 to determine the presence of YCRA. The surveys were conducted between 5:00 AM and 12:00 PM and consisted of walks through and around suitable habitat. Surveyors stopped every 20 to 40 meters to play digital (MP3) audio recordings of YCRA vocalizations including "keks", "clatters", and agitated "kek'ing". The recording was played for up to 2 minutes, with a pause of up to three minutes after each broadcast to listen for a response. Surveys were conducted from March through June and four to seven visits per site. The surveys exceed the U.S. Fish and Wildlife protocol standards for this race.

Yellow-billed Cuckoo (YBCU) - Field surveys were conducted from June through August 2008 to determine the presence of YBCU. The surveys were conducted between 5:15 AM and 12:00 PM and consisted of walks through suitable habitat. Surveyors stopped at regular and opportunistic intervals to play digital (MP3) recordings of YBCU vocalizations, primarily the "ka ka ka ka kow kow kowlp kowlp" call, which was played for 30 to 45 seconds with a 2-minute pause after each play to listen for a response. Surveys were conducted weekly, when possible, from late June to early August, resulting in four surveys at all but one site. A standard survey protocol has yet to be established for YBCU.

YCRA and YBCU longterm trends - YCRA and YBCU surveys began in 2000. YBCU and YCRA survey results are summarized for the Virgin/Muddy River complex.

Other rails, bitterns and Moorhens - Surveys of other rails were conducted coincident with Yuma Clapper Rail surveys. Surveys consisted of broadcasting digital (MP3) audio recordings of Virginia Rail, Sora, Black Rail, Least Bittern and American Bittern coincident with but secondary to Yuma Clapper Rail broadcasts. The sequence of broadcasts were variable. Common Moorhen were noted when observed.

Southwestern Willow Flycatcher - Southwestern Willow Flycatcher (WIFL) were noted when detected. Detections did not adhere to FWS protocol surveys nor were formal surveys conducted. Regardless, a significant number of WIFL were incidentally detected at the Warm Springs Natural Area. Incidental WIFL findings are summarized and discussed below.

Incidental observations - Species lists of incidental birds were constructed from visual and aural detections during survey events. Incidental bird observations are not comprehensive and should be not be over interpreted. Incident bird species observations indicate presence only and should not be interpreted as absence of any one species.

Survey Site Descriptions:

An overview of survey sites for YCRA and YBCU Cuckoo are mapped in Figure 1. Individual sites and surveyed polygons are delineated in figures specific to the survey site. Coordinates for the survey sites are listed in Table 1. Specific site descriptions are as follows:

Virgin River Sites

The Virgin River flows south from Utah and terminates on the Overton arm of Lake Mead. The perennial river flow is largely unaltered with the exception of a few erosion control structures in the town of Mesquite and several minor irrigation diversions. Consequently, the river is susceptible to flooding during warm winter storms or heavy spring runoff. The marsh vegetation along the river, when present, is dominated by cattail (*Typha* spp.) and bullrush (*Scirpus* spp.), with intermixed components of Goodding black willow (*Salix gooddingii*), sandbar willow (*S. exigua*) and tamarisk (*Tamarix* spp.). Wooded areas are present in conjunction with most of the survey sites and are comprised of willow, tamarisk, Fremont cottonwood (*Populus fremontii*), and honey mesquite (*Prosopis glandulosa*).

The survey sites along the Virgin River (Figures 1 through 5) are in the vicinity of Littlefield, Arizona and Mesquite, Mormon Mesa, and the Virgin River Delta in southern Nevada. Survey site coordinates are listed in Table 1. Survey site descriptions and habitat suitability for YCRA and YBCU in the 2008 survey season are reported below. YCRA and YBCU habitat suitability and site occupancy along the Virgin River can and does change dramatically over the years. Readers are strongly encouraged to consult previous reports for a comprehensive perspective of habitat dynamics and suitability for both species.

Desert Springs

The Desert Springs site was established in 2006. The site is located along the Virgin River mesa cut near Littlefield, Arizona approximately 850 meters upstream of the Littlefield North survey site (see below and Figure 2). Habitat at the site is not suitable for YCRA and only marginal for YBCU. Habitat consists of a 350 meter long and up to 80 meter wide isolated strip of mature cottonwoods along the southeastern margin of the Virgin River mesa cut. The overstory is mature Fremont cottonwood on a dry substrate, likely an historical remnant of the Virgin River. The understory consists of tamarisk and honey mesquite, with isolated small patches of yerba mansa (*Anemopsis californica*) and Arizona grape (*Vitis arizonica*). Subterranean springs are the likely water source that maintains the cottonwoods, since several such springs reach the surface downstream of the site near the Interstate 15 overpass.

Desert Springs was not surveyed for YBCU in 2008 due to poor habitat quality.

Littlefield North

Littlefield North is located northwest and adjacent to the Interstate 15 bridge (Figure 2). The site is probably best known for the pair of Common Black-Hawk which have nested there for at least the last ten years, and did so again in 2008. YCRA habitat at Littlefield North has never recovered from the floods of 2005. Suitable rail habitat remains substandard in Beaver Dam Wash and the Beaver Dam Wash/Virgin River confluence. Significantly better YCRA habitat occurs further upstream in Beaver Dam Wash on private property. Littlefield North was assessed for suitability in 2008 but not surveyed due to the lack of habitat. Suitable YCRA (and YBCU) habitat in the upstream areas of Beaver Dam Wash were not surveyed due to private property constraints.

In contrast to the YCRA habitat, YBCU habitat at Littlefield North is still quite suitable. The habitat consists of approximately 10 acres of gallery Fremont cottonwood with a sand bar willow and tamarisk understory. The understory is dry and damaged by range cattle. Additional

YBCU habitat (on private property) contagious with Littlefield North along Beaver Dam Wash and upstream of the site extends the suitable YBCU habitat by at least 40 acres. YBCU surveys were conducted in 2008, but were restricted to public access areas.

Littlefield South

Habitat at Littlefield South (Figure 2) has matured significantly since the 2007 surveys. The irrigation canal that arcs around the north and west perimeter of the site is active and beavers have once again constructed a dam on the site border with the Virgin River on the south. The hydrology at the site has been significantly improved by seepage from the now unlined canal and water retention behind the beaver dam. Consequently the YCRA habitat has re-established in the center of the site, albeit only a quarter (about 2 acres) of its size prior to the 2005 floods. The existing habitat is excellent. YCRA habitat consists of dense cattail and *Scirpus* surrounded by cottonwood, Goodding black willow and tamarisk, in that order. The site was surveyed for YCRA in 2008.

YBCU habitat has likewise established at the site. The habitat now is larger (about 5 acres) and more robust than its original state (before the 2005 floods). Fremont cottonwood now dominates the site, and reaches heights of 10+ meters. Significant amounts of Goodding's black willow and sandbar willow are also present, the former reaching heights of 7+ m. Tamarisk cover has been substantially reduced. The site was surveyed for YBCU in 2008. This was the first time habitat was suitable for YBCU at this site since surveys began in 2000.

Range cattle, no more than a dozen, were present in both YCRA and YBCU habitats at the start of the survey season (March) but were gone by mid-May. There had been little damage.

Mesquite Bridge

YCRA habitat at the Mesquite Bridge site (Figure 3) is excellent, but there have been significant encroachments on the habitat from golf courses and associated urban developments downstream of the bridge. High quality cattail and *Scirpus* habitats have been reduced by approximately 50% in the downstream area. The remaining habitat at the same downstream location remains separated from the main Virgin River channel by dikes constructed after the 2005 floods. Thus the remaining habitat is still largely linear, interposed between the improvised dike structure to the south and urban/golf course expansions to the north. The habitat still appears to be watered by subsurface flows, golf and agricultural runoff, and other unidentified drains originating in the town of Mesquite.

On the upstream side of the bridge, the YCRA habitat is intact, consisting of dense cattail marshes averaging 3 meters tall in ponds approximately 10 hectares in size (combined) outside of but adjacent to the main flow channel. Cottonwood and black willow are beginning to infiltrate areas immediately at and upstream of the bridge. The perennial structure, composition and hydrology of the habitat in this area of the site easily qualified as high quality WIFL habitat in 2008, and should be likewise for WIFL and YBCU in 2009.

The Mesquite site was surveyed for YCRA in 2008. The site was not surveyed for YBCU due to lack of habitat. There were no incidental WIFL detections at this site in 2008, though the habitat is excellent.

Mesquite Bridge 3

The Mesquite Bridge 3 site (Figure 3) was established for YCRA in 2007. Habitats are generally linear, variable in height, occur both along the main flow channel and outside of the improvised flood dikes, and include a large nonlinear water impoundment at the northwest upstream portion of the survey area. Habitats are dominated by cattail and sedges. Cattails range from 1 to 3 meters tall. Perennial habitats consist predominately of black willow with lesser amounts of cottonwood. Emergent perennial habitats occur along the length of the survey area and range from 2 to 4 meters tall. The best rail habitats are at the upstream portion of the site, just below and above a concrete control structure that bisects the Virgin River. Aside form normal habitat maturation, habitats at Mesquite Bridge 3 are essentially unchanged from 2007. Excellent rail habitat, though somewhat patchy, occurs throughout the survey site. The site was surveyed for Yuma Clapper Rail in 2008. Habitats were not yet suitable for Yellow-billed Cuckoo, but likely to become suitable by 2009.

Mesquite Bridge 2

YBCU habitat at the Mesquite Bridge 2 site (Figure 3) is essentially unchanged from the previous year. The downstream half of the site burned several years back, and the habitat is still in recovery stages. In general, the habitat consists of a long linear grove of mature black willow and cottonwood positioned between the southeast high waterline of the Virgin River and adjacent agricultural fields. Willows are upwards of 7 m, cottonwoods are up to 15 m. The understory is tamarisk and sandbar willow. WIFL were present and breeding at this site from 1997 through 2000. There is no Yuma Clapper Rail habitat at the site. The YBCU habitat is excellent and the site was surveyed in 2008.

Big Marsh

Big Marsh is located along the northwestern side of the Virgin River near Mormon Mesa (Figure 4). The marsh is fed by a spring as well as seasonal inflow from the Virgin River, the later depending on the alignment of the river and largely confined to winter and early spring. There was no surface connection between the Virgin River channel and the marsh by early June of 2008. This is the same condition as occurred in 2007.

Overall, habitats along and adjacent to Big Marsh have stabilized since the 2005 floods, but the habitats are complex, both in composition and stature. The margins of the marsh are composed of small strips and patches of sedges and cattail, but primarily dominated by tamarisk. Beyond the margins, the east and southeast habitats are dominated by dense tamarisk stands from 1 to 3 m tall. Beyond the north and northeastern margins, the habitat gradient starts with dense tamarisk and blends into dense stands of Goodding, black, and sandbar willow with a tamarisk understory. The Goodding willow exceeds 7+ m in some areas. The habitat is poor quality for YCRA on the southeast and western margins of the marsh, but moderate on the northern portion of the marsh. A 150 m long “finger” of high quality YCRA habitat, composed entirely of dense cattail, begins approximately 300 m upstream of the confluence of the marsh with the Virgin River. Technically, this “finger” is not part of Big Marsh but rather the northern high water edge of the Virgin River channel.

YBCU habitat also occurs at Big Marsh, but the extent, composition and distribution is likewise complex. Generally speaking, the black willow at Big Marsh extends beyond the

YCRA surveyed area and continues down both banks of the Virgin River (see Figure 4). There are large areas of black willow blending with mature tamarisk on both sides of the Virgin River, that overlap and extend far beyond the YCRA survey area at Long Marsh. Collectively, the YBCU habitat is excellent, and Big Marsh, Long Marsh and associated areas were surveyed concurrently, as in previous years, for YBCU in 2008.

Long Marsh

In previous years, Long Marsh was a 1.5 kilometer linear stretch of marsh habitat that ran parallel to, and down the center of, the Virgin River channel near Mormon Mesa (Figure 4). Aside from large flood events, the active portion of the Virgin River channel has been some distance (approximately 500 m) to the east of Long Marsh since 2005. Historically the habitat was complex. Extensive and robust cattail patches were distributed between and under tall (3+m) dense tamarisk and mature black willow (7+ m). Sandbar willow was a common component in the more mesic areas. By the 2008 survey season, feral cattle and rerouting of the Virgin River after the 2005 floods had resulted in significant changes in the marsh. Cattail were no longer extant to any appreciable level and there was no appreciable water inflow to the marsh. Overall, the marsh is now dry and no longer suitable for YCRA. The black willow and tamarisk have faired better than the marsh habitat. Excepting a 2 ha patch, which was declining for many years now, the vast majority of black willow remain robust and healthy, as does the tamarisk. Habitat at Long Marsh, and beyond, is still good to excellent for YBCU.

A suitability survey was for YCRA was done at Long Marsh at the beginning of the 2008 survey season, but no protocol surveys were conducted due to lack of habitat. Long Marsh, in conjunction with Big Marsh and extended areas (see Figure 4), were surveyed for YBCU in 2008.

East Marsh

East Marsh was a small circular patch of marsh habitat on the east side of the Virgin River, roughly east of Long Marsh (Figure 4). East Marsh has been dry and devoid of live vegetation since the 2005 floods. Conditions remained unchanged in 2008 and no surveys were conducted due to lack of habitat.

Virgin River Landing and *Fisherman's Cove*

In previous years Virgin River Landing and Fisherman's Cove (Figure 5) were inundated by Lake Mead. Reduced lake levels exposed these sites in 2002, which quickly became populated with emergent vegetation. Floods in 2005 scoured both survey sites of vegetation and entrenched the Virgin River channel. The river channel remains entrenched at Virgin River Landing, up to 6 meters deep in some places, and range cattle have grazed off any emergent vegetation. Incipient rail habitat at Fisherman's Cove was grazed off and never developed further. The Virgin River Delta, which was proximal to both sites in 2005, has moved many kilometers south coincident with the continuing drop in water level of Lake Mead. There were no suitable YCRA or YBCU habitats at Virgin River Landing and Fisherman's Cove in 2008.

Muddy River Sites

The survey areas on the Muddy River begin upstream in the Moapa Valley west of

Glendale and terminate near Lake Mead (Figures 1, 6, 7, 8, 9, and 10). The channel and perennial flows are heavily modified and re-directed east of Glendale by a complex series of flood control structures, agricultural channels, agricultural drains, canals, and waterfowl management diversions. Habitats at the Muddy River sites vary greatly in the degree of openness, vegetation composition and vegetative structure. Thus, habitat conditions for YCRA and YBCU vary by site. In general, the habitats consist of cattail, bullrush, and common reed (*Phragmites australis*) with intermixed components of Goodding black willow, sandbar willow, tamarisk, Fremont cottonwood, and honey mesquite. Survey site coordinates are listed in Table 1. Survey site descriptions and habitat suitability for YCRA and YBCU in the 2008 survey season are reported below. YCRA and YBCU habitat suitability and site occupancy along the Muddy River, particularly at the OWMA, has change dramatically over the years. Readers are strongly encouraged to consult previous reports for a comprehensive perspective of habitat dynamics and suitability for both species.

Warm Springs Natural Area (WSNA)

The Warm Springs Natural Area (WSNA) was designated as Warm Springs Ranch in previous reports. Warm Springs Ranch was purchased by SNWA in 2008, which enabled greater access and established the primacy of habitat conservation for the site. The WSNA is located in the Moapa Valley in southern Nevada, approximately nine miles west of Glendale and one mile south of Highway 168 (Figure 6). The site is adjacent to but not on the Muddy River. Surface flows on the site mostly originate from Warm Springs, located approximately 1 k south of the Muddy River. Water from the springs flow through the area in a complex series of canals. Incipient springs can be found in several areas previously used as pastures. Water from the site drains to the Muddy River north of the site. Habitats on the approximately 1,400 acres are complex. Fremont cottonwood, black willow, velvet ash (*Fraxinus velutina*), tamarisk, and fan palms (*Washingtonia filifera)* are associated with many of the canals and drains. Pasture lands, in various stages of succession, occur between the canal and drain networks. Mesquite trees are a major component of the drier areas, either singly or in the form of large mesquite bosques. In general, there is a sub-surface moisture gradient running from the south to north. Trees and perennial shrubs roughly follow this gradient. Where present, tree canopies range from a few meters to 15+ meters. Significant marsh habitats are present, mostly in the south central portion of the site, and consist of cattail, sedges, and other varieties of wetland plants.

High quality YCRA and YBCU habitats occur in large proportions at the site, especially in the southern third. The site has been surveyed for YBCU in previous years by SBCM cooperatively with Bob Furtek of the Nevada Division of Wildlife. Prior to these surveys, WSNA was surveyed for YBCU by an independent group. To our knowledge, the site has never been surveyed for YCRA. Both YCRA and YBCU surveys were conducted in 2008.

Bowman Canal

Bowman Canal is a site along an inflow canal for Bowman Reservoir in the town of Logandale (Figure 7). The canal site is approximately ten meters wide and 250 meters long with three small ponds at the reservoir's intake. In its undisturbed state the vegetation consists of dense cattail lined by willow and cottonwood groves. The canal was cleared of vegetation before the 2006 survey season and the clearing now appears to be an annual event. There was no

suitable rail or cuckoo habitat during the 2008, and no surveys were conducted. Left undisturbed the habitat at this site has the potential to return to suitable YCRA habitat. There is no YBCU habitat at the site.

Grant Bowler Park

The Grant Bowler Park site is located east to northeast of Grant Bowler Park in the town of Logandale (Figure 8). Vegetation at this site are composed of cattails, sedges, tamarisk, willow and cottonwood. The site is deeply entrenched with steep banks. The site has also burned. Habitat at this site was not suitable for rail or cuckoo since 2006 and has remained unchanged. No surveys were performed in 2008. Left undisturbed and with modifications to the banks, the habitat at this site has the potential to return to suitable YCRA habitat. There is no YBCU habitat at the site.

Maverick Ditch

The Maverick Ditch site is located in the town of Overton near the intersection of Cooper Street and Jones Street (Figure 9). The site was named after the Maverick convenience store south of the site. The channel appears to function for irrigation drainage. The site is not on the active flow portion of the Muddy River. The surveyed area is approximately 400 meters long and 50 meters across at its widest point. A majority of the site has been burned annually beginning in 2004, but habitat recovery is rapid. The site is dominated by cattail, bulrush, common reed, tamarisk and yerba mansa averaging one to two meters tall, depending on the time since burning. A tamarisk removal/eradication project appears to be in progress since 2007. The surveyed area is bordered by homes and businesses in a rural setting. Maverick Ditch was surveyed for YCRA in 2008. The habitat is not suitable for YBCU.

Overton Wildlife Management Area (OWMA)

The Overton Wildlife Management area (OWMA), operated by the Nevada Division of Wildlife (NDOW), encompasses multiple survey areas for YCRA and YBCU. Suitable habitats vary in size and quality, depending on the site. Site descriptions are as follows:

Honeybee Pond

Honeybee Pond is located on the northernmost portion of the OWMA near Overton, Nevada (Figure 10). The site was subdivided during past surveys into Eastern and Western sites, but sites were combined in 2004 when the western site was drained. Honeybee Pond is actively managed for waterfowl, thus the habitat is composed of large expanses of cattail and reeds interspersed with open water. The site is bordered on the south by the Muddy River, which is contained by dikes. Habitats along the Muddy River canal are predominately composed of tamarisk. The thalweg of the canal is dredged irregularly among years. Rail habitat at Honeybee Pond is composed of dense monotypic patches of cattail varying in height from 3 to 4 meters tall. Proportions of vegetated versus open water habitat vary among years due to management practices. In 2008, the cattail had expanded considerably, and covered approximately half the surface area of Honeybee Pond by the end of the 2008 survey season. The habitat is excellent for YCRA, other rails and Least Bittern (LEBI). YCRA surveys were conducted in 2008.

Two patches of YBCU habitat occur east and southeast of Honeybee Pond (Figure 10).

Perennial habitat on the eastern patch is composed of palms, willows and cottonwoods, with large intervening areas of cattail and low profile tamarisk. Habitat to the southeast is composed of a dense, mature, linear and compact grove of tamarisk and Goodding's black willow surrounded by cattail marshes and a complex series of dikes with black willow and tamarisk boarders. The extent of perennial habitat at both locations are confined to well defined patches with open and park-like intervening areas of lower profile annual and perennial vegetation dominated by tamarisk. Both patches were surveyed for YBCU in 2008.

Refuge Housing Area

The Refuge Housing Area site (Figure 10) is located, as the name suggests, adjacent to the OWMA housing and OWMA headquarters, mostly south of Wildlife Road. The habitat is park-like, composed of mature cottonwood and locust trees up to 15 meters tall embedded in an open park-like areas. The areas of grass are maintained regularly. The YBCU habitats are within easy "flying distance" of the "Maintenance Shed Site" (see below) for YBCU. Birds using this site likely also to use the Maintenance Shed site. Habitat at the Refuge Housing Area is excellent for YBCU and was surveyed accordingly in 2008. There is no suitable YCRA habitat at this site.

Maintenance Shed

The Maintenance Shed site is located south-southeast of the OWMA housing area (Figure 10). The site was named for the maintenance sheds and "bone" yard used for service operations on the OWMA. Habitat at this site is classically park-like. Access roads are lined by cottonwoods and other areas are composed of grass. A network of narrow canals move water to a series of adjacent ponds on the north and east that are managed for waterfowl or upland game, depending on the prescription. The cuckoo habitat at the site is excellent, but limited. In pervious years, YBCU likely moved freely between the Maintenance Shed site, the Refuge Housing site, the Willow Strip site and possibly beyond. YBCU and surveys were conducted at the Maintenance Shed site in 2008. There was no YCRA habitat at or adjacent to this site in 2008.

Southwestern Willow Flycatcher

The Southwestern Willow Flycatcher site was established in 2005 and surveyed for YBCU through 2007 (Figure 10). The habitat consists of a 300 meter strip of dense, mature Goodding black willow with a sandbar willow and very dense tamarisk understory. The site is on the Muddy River, which is confined by an artificial channel. The site was named after Southwestern Willow Flycatchers that were incidentally found at the site in 2005 by SBCM biologists. Access to the site in 2008 had been compromised by channelization work on the OWMA. However, the site is proximal to the Willow Strip site (see below) and within easy flying distance by YBCU. Due to access problems and its close association with the Willow Strip site, the Southwestern Willow Flycatcher site was not surveyed for YBCU in 2008. There is no suitable YCRA habitat at the site.

Pintail Pond

The Pintail Pond site (Figure 10) is composed of a series of interconnected ponds

managed for waterfowl. The ponds are filled intermittently among years from a network of canals and diversions originating from the Muddy River. Some years the site is bordered by cattails around the margins of the pond. The center of the pond is open shallow water when flooded. The size and extent of rail habitat varies from year to year, depending on the waterfowl management prescriptions being applied. The pond have been dry and devoid of YCRA habitat since 2007. No rail surveys were warranted in 2008 due to lack of habitat.

Willow Strip

The Willow Strip site (Figure 10) is located east of Pintail Pond site. The access dike road is lined with linear strips of mature Goodding's black willow from 3 to 7m tall. Coverages range from continuous to patchy. Habitats bordering the eastern side of the access road, beyond the black willows, are composed of dense tamarisk and mesquite up to 4 meters tall. The Pintail Pond site (see above) lies to the west, the Southwestern Willow Flycatcher site (see above) is approximately 500 m to the north, and Blind 30 (see below) to the south. The habitat at the Willow Strip site in past years has been excellent for YBCU. However, due to the lack of water in the adjacent ponds, the habitat has become increasingly distressed, though still above average for YBCU. The site was surveyed accordingly in 2008. There was no suitable YCRA habitat at the site in 2008.

Blind 30

The Blind 30 site (Figure 10) was established in 2007 for YBCU. The site consists of a large, approximately 20 hectare, water impoundment managed for waterfowl. Goodding's black willow, sandbar willow and tamarisk line the dikes that encompass the impoundment. Perennial heights range from 1 to 7m. The distribution of perennial vegetation around the dike is patchy to continuous, consisting of a few trees to 100+ m stretches of continuous perennial cover, and is most dense along the northern, eastern and southern boarders. YCRA habitat at Blind 30 did not exist in 2007, but significant amounts of rail habitat have since emerged. Suitable to excellent YCRA habitat now exists around the margins of the site. Additional YCRA habitat is also present approximately 100 m to the east and southeast of the site. Habitat at the site is still excellent for YBCU. Blind 30 was surveyed for both YBCU and YCRA in 2008.

Mike's Site

Mike's Site (Figure 10) was first surveyed for YBCU in 2007. The site has two areas. The sites are roughly located along the access road leading to South Marsh (Figure 11). YBCU habitat at the sites consists of small isolated mature cottonwood patches embedded in a vast expanse of tamarisk associated with the OWMA water impoundments and canals. The small patches are within flying distance and YBCU were observed in 2007 flying between the patches. Mike's Site is also within flying distance of the South Marsh (see below) and Blind 30 (see above) sites, and possibly beyond. Fremont cottonwood at the two patches comprising Mike's Site are mature, up to 15 meters tall. The surrounding habitat is mature tamarisk, up to 4 meters tall, dense and continuous. The habitat at Mike's Site is suitable for YBCU, but not YCRA. The site was surveyed for YBCU in 2008.

South Marsh

The South Marsh site (Figure 10) is the southeastern most survey site on the OWMA. The site is composed of two large water impoundments bordered by access roads that surround and bisect the site. Collectively, these impoundments cover several hundred hectares. The habitat is composed of monotypic cattail patches up to 400 meters wide and nearly 1 kilometer long. The access roads on the dikes are irregularly and infrequently lined with Goodding's black willow, cottonwood, sandbar willow and tamarisk. The South Marsh site comprises the best and most extensive YCRA habitat on the OWMA. The site is managed for waterfowl. South Marsh was inundated at the beginning of the 2008 YCRA survey season, but drained shortly afterwards. The site was surveyed for YCRA in 2008 until the habitat was no longer suitable.

Small patches of YBCU habitat, consisting of willows and cottonwoods occur along the western dike road that bisects the two large water impoundments. The small habitat patches are not, in themselves, big enough to support YBCU, however the patches are within reasonable flying distances from Mike's Site. Mike's site (see above), which had YBCU in 2007 (Braden et al. 2008), is proximal to the YBCU habitat at South Marsh. South Marsh was surveyed for YBCU in conjunction with Mike's Site in 2008.

RESULTS

Yuma Clapper Rail

YCRA survey results for 2008 are presented in Table 2 and plotted in Figures 11 and 12. UTM coordinates are tabulated in Table 4. A total of 12 YCRA were detected, with birds occurring at Honeybee Pond, Blind 30 and South Marsh.

At Honeybee Pond (Figures 10 and 11) YCRA were detected on five of seven surveys, with a maximum number of 7 birds detected on 25 June. Dueting pairs were detected on 14 April, 28 May and 10 June. A family group of six were detected on 25 June. And, there were multiple single detections across the survey season (Table 4). Detections were distributed throughout Honeybee Pond.

At Blind 30 (Figures 10 and 12), YCRA were detected on four of six surveys, with the maximum of 4 birds detected on 14 May. One pair was detected on 14 May with the remaining detections being single bird (Table 4). Birds were detected both inside and outside the dike road that encompasses the site. Detections occurred on the east and southeast perimeter of the site with the majority of detections being in the southeastern portion of the surveyed area.

At South Marsh (Figures 10 and 12), one YCRA was detected on a single survey. South Marsh was being drained when the survey season began. By 30 April, the habitat was marginal at best, and there were no further YCRA detections.

Yellow-billed Cuckoo

YBCU survey results are presented in Table 3 and plotted in Figure 13. UTM coordinates are tabulated in Table 4. A total of 3 YBCU were detected. All detections occurred at the Warm Springs Natural Area (Figures 6 and 13). A pair of YBCU were detected on 26 June and were under observation for over one hour. Neither bird could be relocated on subsequent visits. A single YBCU was observed on 8 July. The bird responded behaviorally to

the tape, but not vocally. The bird could not be relocated on subsequent visits.

YCRA and YBCU longterm trends - Results of YCRA and YBCU surveys since 2000 are summarized by year and survey sites in Tables 5 and 6 respectively. The 2008 season had the fourth highest number of YCRA detections since surveys began in 2000. Of the Muddy River sites, the OWMA sites continue to be the most consistently occupied YCRA habitats since 2005. Of the Virgin River sites, the Mesquite Bridge has been the most consistently occupied site over the years.

Longterm YCRA detections and site occurrences continue to suggest cyclical occupancy patterns. The cyclic pattern is coincident with natural and anthropogenic changes in available YCRA habitat. Parsimony suggests fluctuations in available YCRA habitat is the primary factor affecting YCRA occurrences along the Virgin/Muddy River complex.

YBCU detections dropped in 2008 to the third lowest number since surveys began in 2000. In particular, YBCU detections at the OWMA, the most consistent detection sites since 2005, were negative in 2008. As with YCRA, longterm YBCU data also suggest cyclical occupancy, but the ultimate factors responsible for the cyclicity are not well understood.

Other Rails, Bitterns and Moorhens

Detections of other rails, bitterns and Common Moorhen are tabulated in Table 2. A minimum of 72 Virginia Rail (VIRA) were known to present in the 2008 survey season. VIRA were detected at every survey site with suitable rail habitat except Littlefield South. VIRA were the most abundant rail detected, and were most abundant at South Marsh (18 birds on 21 March) until the ponds were drained, after which their numbers declined precipitously. VIRA were likewise the most abundant rail at the Warm Springs Natural Area (17 birds on 16 April), and were consistently abundant throughout the 2008 survey season.

A minimum of 21 Sora were known to be present during the 2008 surveys. This a threefold increase over the 2007 survey season when a total of 7 birds were known to be present. Sora were detected at all survey sites with suitable habitat except the Maverick Ditch. Sora detections and distribution increased significantly from the 2007 survey season.

A minimum of 10 Least Bittern (LEBI) were known to be present during the 2008 surveys. LEBI were detected at the Mesquite Bridge, Mesquite Bridge 3, Warm Springs Natural Area, Honeybee Pond and Blind 30. LEBI were most abundant at Honeybee Pond.

A total of 9 Common Moorhen (COMO) were know to be present during the 2008 surveys. COMO were detected at Mesquite Bridge, Honeybee Pond, Blind 30 and South Marsh. COMO were most abundant at Honeybee Pond.

American Bittern and Black Rail were not detected in the 2008 survey season.

Southwestern Willow Flycatcher

Incidental Southwestern Willow Flycatcher (WIFL) detections were limited to the WSNA. Locations are plotted in (Figure 13), UTM coordinates are tabulated in Table 7. There were 9 detections of WIFL, either as single birds, pairs or combinations of pairs. Based on the date and behavior of the birds, the evidence suggests there were at least 5 WIFL pairs, including a possible polygamous group, breeding on the WSNA in 2008. One abandoned WIFL nest was found 22 July. The nest was apparently unsuccessful as there was no evidence that nestlings had

been present.

It is important to note that WIFL detections/observations did not follow WIFL survey protocol. And, there is a high likelihood WIFL were present at other locations on the WSNA in 2008. Regardless, incidental observations confirm that WIFL were present and breeding at the WSNA in 2008.

Incidental Bird Species Detections

Incidental bird species detected during 2008 YCRA and YBCU surveys are tabulated in Table 8. A total of 146 bird species were incidentally observed. The number is up from 139 birds species detected in 2007. A significant portion of the increase is likely due to greater access to WSNA. Among the more interesting species observed were Southwestern Willow Flycatcher, Solitary Sandpiper and Vermillion Flycatcher. Southwestern Willow Flycatcher have been previously mentioned. The Solitary Sandpiper is a long distance migrant which breeds on the tundra, yet a single individual lingered at the same location (photos available on request) for approximately one month beginning in mid-March. Vermillion Flycatcher were already know to be abundant and breeding on the WSNA, and incidental observations indicate this is still the case in 2008. At least 40 Vermillion Flycatchers were observed at the WSNA in the 2008 survey season.

It is important to note that incidental bird species detections were incidental to YCRA and YBCU surveys. Incidental bird detections should not be over-interpreted, since they are not based on rigorous bird census methodologies. Incidental bird species observations indicate presence, but not absence of a bird species from a site.

DISCUSSION

Yuma Clapper Rail

Twelve YCRA were detected in the 2008 season, down from the 19 YCRA observed in the 2007 season. Part or most of the change can be attributed to changes in the available YCRA habitat at Honeybee Pond, Blind 30, South Marsh and Mesquite Bridge from 2007 to 2008. On the plus side, YCRA habitat at Honeybee Pond nearly doubled in size as a result of cattail and bulrush infiltrations from the margins of the pond into the open water. Proportional cover on Honeybee Pond was about 50% cattail/bulrush and 50% open water at the end of the 2008 survey season, at least double the size of the YCRA habitat in 2007. YCRA occupancy increased accordingly from 3 birds in 2007 to 7 birds (including a family group) in 2008. Also on the plus side, YCRA habitat was not suitable at Blind 30 in 2007, yet in one year, the rail habitat matured, expanded and was occupied by 4 YCRA in 2008.

On the minus side, YCRA habitat at South Marsh, where 14 YCRA occupied the site in 2007, had only 1 detection in 2008. The YCRA habitat at South Marsh degraded rapidly at the start of the 2008 survey season when the marsh was drained. It is unlikely the YCRA detected in 2008 was paired or bred at South Marsh in 2008, since subsequent surveys (from 30 April on) were negative and the habitat in general was no longer suitable (for any rail species) due to lack of water. To some degree, but not all, the new habitat at Blind 30 compensated for habitat lost at

South Marsh in 2008. Also on the minus side, available YCRA habitat at the Mesquite Bridge site had been substantially reduced by suburban encroachment. More specifically, the habitat were a pair of YCRA was detected in 2007 had been replaced by golf greens and houses by 2008. There were no YCRA found at the Mesquite Bridge site in 2008.

WSNA is a promising site for YCRA habitat development. Significant areas of YCRA habitat are already present, and pasturage which had been grazed by the previous tenants was already going through rapid successional recovery by the end of the 2008 survey season. No actions are recommended at this time to facilitate YCRA habitat recovery, other than letting the habitat recover naturally, without further disturbance.

WSNA rail habitat also has potential for Black Rail. No Black Rail were detected in the 2008 surveys, but rail survey times were oriented to YCRA. Black Rail are most active and responsive between 2:00 A.M. to 4:00 A.M. The current data are not adequate to establish either the presence or absence of Black Rail at the WSNA. Presence/absence cannot be determined with confidence until surveys are done at the appropriate time.

Annual changes in YCRA habitat along the Virgin/Muddy River complex are not unusual. The 2005 flood had the greatest single season impact on YCRA habitats on the Virgin/Muddy River complex since YCRA surveys began in 2000. The 2005 survey season was the only year, out of eight years of monitoring, where no YCRA were detected at any site. The 2005 natural flood event affected virtually every survey site (Miller et al 2006). Nevertheless, rail habitat and YCRA had reestablished by 2006 and 2007 (Braden et al 2007, 2008). Habitat disruptions from natural disturbances can be widespread and unavoidable. But survey results confirm the disruptions from natural events are temporary.

In contrast, habitat disturbances from anthropogenic disturbances are more vexing. YCRA habitat is being both created and destroyed by human activities. For example, channelization activities on the Virgin River coincident with the 2005 floods both destroyed and created YCRA habitat. The habitat created below the Mesquite Bridge site has been steadily replaced over the years by golf greens, houses and dike modifications. YCRA, and now WIFL, habitats at the bridge will likely be impacted by upcoming bridge modifications. On the plus side, YCRA habitat upstream of the bridge at the Mesquite Bridge 3 site was intact and flourishing at the end of the 2008 survey season. Anthropogenic activities at the Mesquite sites clearly have great potential to either impact or enhance YCRA habitat.

Another example fo anthropogenic activities both positively and negatively affecting YCRA habitat is at the OWMA. The OWMA is clearly an asset to YCRA in southern Nevada. The OWMA provides thousands of acres of YCRA habitat incidental to water fowl management. And, the OWMA has had the most consistent occurrences and relatively high numbers of YCRA over the last three years. On the other hand, waterfowl management activities on the OWMA have also destroyed many acres of YCRA habitat. For example, Honeybee Pond was drained and cleared of excessive cattails in 2004, and YCRA did not return to the site until 2007. South Marsh had the highest YCRA count of all the sites in 2007 (14 birds), but was drained for maintenance early in the 2008 YCRA season. The conflict between creation and destruction of YCRA habitat on the OWMA might be mitigated by scheduling pond maintenance outside of the YCRA nesting/breeding season. Again, the OWMA is clearly an asset to YCRA, but the beneficial aspects can be significantly enhanced by careful scheduling of waterfowl enhancement

operations.

A third example of anthropogenic activities affecting YCRA is at the Maverick Ditch site. The Maverick Ditch site has burned every year starting in 2004. The burning appears to be preventive fire control as several houses and business are nearby. More recently, the burning may be part of a tamarisk control program, since the tamarisk at the site are being cut and piled. No YCRA have been detected at this site since the annual burning treatments began. Pre-emptive fuel reduction is one means to prevent loss of life and property from uncontrolled fire, which is certainly a priority, but it is not the only treatment option. YCRA and YCRA habitat at the site would be enhanced by using other wildfire control options, such as a fuel buffer zone around the site, or possibly biannual (or tri-annual?) controlled burns in conjunction with buffer zones.

A fourth example of anthropogenic activities affecting YCRA is at the Bowman Canal. The Bowman Canal is an inflow channel from the Muddy River to Bowman Reservoir. Bowman Reservoir is an irrigation reservoir and recreation site in the Moapa Valley. Bowman Canal is mechanically scoured of all vegetation every winter, presumably to facilitate water intake to the reservoir. YCRA habitat would be significantly enhanced by scheduling vegetation removal after the YCRA breeding/nesting season. Another possible option to consider is to scour the thalweg of the canal, leaving the margins to develop into YCRA habitat. There are many other sites and opportunities to enhance YCRA and YCRA habitats on the Virgin and Muddy Rivers complex coincident with anthropogenic activities.

A fifth and final example of anthropogenic effects on bird species on both the Virgin and Muddy Rivers is cattle grazing. Range and feral cattle continue to degrade YCRA habitat on the Virgin and Muddy Rivers. A large group (40+) of apparently feral cattle (no brands or ear tags) continue to degrade YCRA habitats at the Mormon Mesa sites. Further downstream, cattle continue to graze emergent rail habitats at Fisherman's Cove and Virgin River Landing. Cattle have become a pest on the OWMA over the past years, coincident with water elevation decline in Lake Mead. The OWMA has erected an exclusion fence, a proactive move on their part, but the fencing does not include Blind 30, South Marsh and areas to the east. Cattle are also present at Littlefield North and Littlefield South. Clearly, there is a great potential to enhance YCRA and YCRA habitats by controlling/confining range and feral cattle.

Yellow-billed Cuckoo

YBCU detections and observations declined dramatically from 12 in 2007 to 3 in 2008. Detections in 2008 were confined to the WSNA, where one pair and one individual were observed relatively early in the season. Subsequent surveys were negative and there was no further evidence to suggest YBCU nested at any of the survey sites, including the OWMA and Mormon Mesa sites.

The spatial and temporal shifts of cuckoo detections since SBCM surveys began in 2000 remain difficult to interpret. YBCU were relatively abundant on the OWMA in 2007 (8 of 12 detections) but absent in 2008. There were 4 YBCU at Mormon Mesa in 2007, but none in 2008. The conventional wisdom reports a large (7+ pair) YBCU breeding population at WSNA early in this decade, but SBCM and NDOW surveys have never found more then 3 in any one year since

surveys began in 2003, the 3 birds having been detected this survey season.

Putative factors affecting YBCU spatial and temporal breeding season distributions in southern Nevada are many, but there are few answers. Habitat loss and degradation can obviously affect YBCU breeding season occurrences, but YBCU habitats on the Virgin/Muddy River complex, with a few minor exceptions, appear to be stable and predictable since surveys began in 2000. The size of available habitat (patch size) might also affect occupancy. But available habitat for YBCU appears to be extensive, particularly at WSNA, Mormon Mesa, OWMA and Littlefield North. Food resource availability could reasonably affect occupancy. But, there are no data to assess the effects of changes in food availability, if any. The irruptive nature of YBCU in the American Southwest in general has yet to be investigated in a rigorous scientific venue. At this point in time, the mechanism affecting the occurrence of YBCU in southern Nevada are simply not known. The survey data indicate occupancy is cyclic and potentially uncoupled from habitat, but that is all we know. Given this lack of understanding, management for YBCU on the Virgin Muddy River complex is limited to preserving and enhancing existing habitat.

WSNA: Southwestern Willow Flycatcher

WIFL detections at WSNA were incidental, and did not adhere to FWS survey protocol. Nevertheless, detections and observations conclusively establish that WIFL were present and breeding on the WSNA in 2008. The WSNA has great potential for this species, including areas that were not visited, incidentally or otherwise, during our 2008 YCRA and YBCU surveys. Focused WIFL surveys at WSNA should be considered to determine the number of birds, their use areas, avoid impacts and to identify enhancement opportunities for this species.

SUMMARY

Yuma Clapper Rail

1) Twelve (12) YCRA were detected during the 2008 surveys. Detections were confined to the OWMA. YCRA were detected at South Marsh (1), Honeybee Pond (7) and Blind 30 (4). YCRA pairs were detected at Honeybee Pond and Blind 30. One family group was detected at Honeybee Pond.

2) YCRA habitats increased in 2008 at Honeybee Pond, Blind 30 and Littlefield South. YCRA habitat increases appeared to be a result of natural processes and waterfowl management practices.
